

# Aquaplanet sensitivity in CAM 4&5

**Brian Medeiros**

[brianpm@ucar.edu](mailto:brianpm@ucar.edu)

with help from: **D. Coleman, R. Neale, D. Williamson**

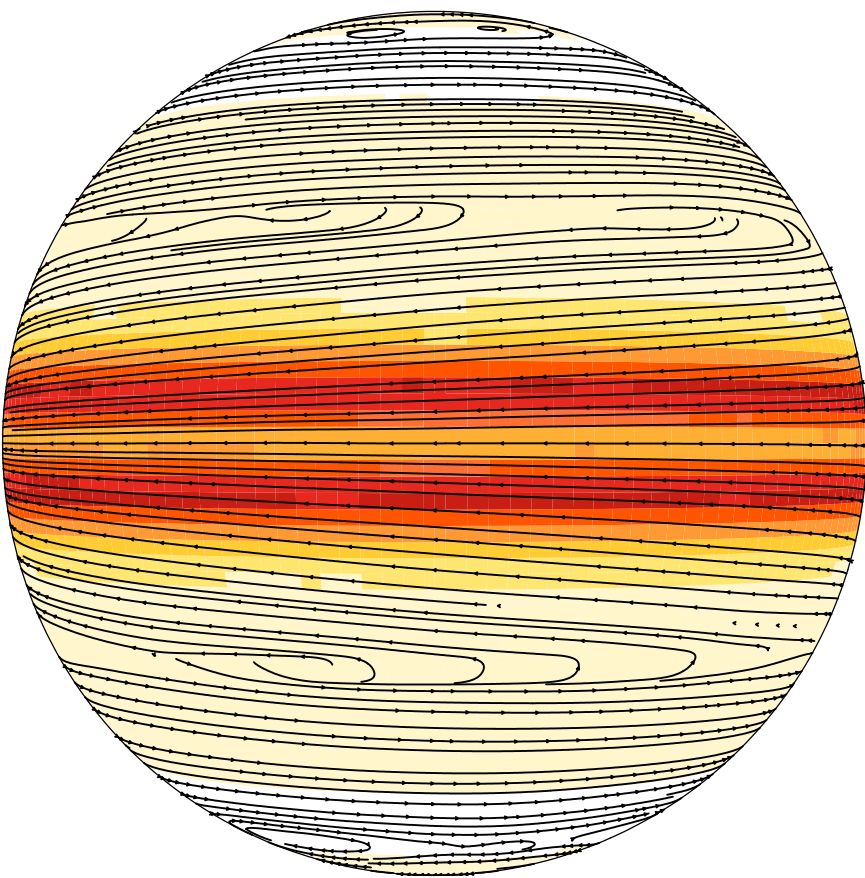

# The Point

Extend previous efforts

Examine CAM4/CAM5 cloud response

Develop strategies/expectations for upcoming CMIP/CFMIP experiments

# The Review (I)

CAM5 Aquaplanet

APE SST profiles and conventions

“Cess-type” experiments.

Compare Earth v. Aquaplanet results

# The Review (2)

climate sensitivity:

▸  $\lambda = \Delta T / G$

cloud effect:

▸  $\lambda / \lambda_{clr} - 1 = \Delta CRF / G$

Response tied to low-cloud response in subsiding regimes.

# The Review (2)

climate sensitivity:

▸  $\lambda = \Delta T / G$

cloud effect:

▸  $\lambda / \lambda_{clr} - 1 = \Delta CRF / G$

Response tied to low-cloud response in subsiding regimes.

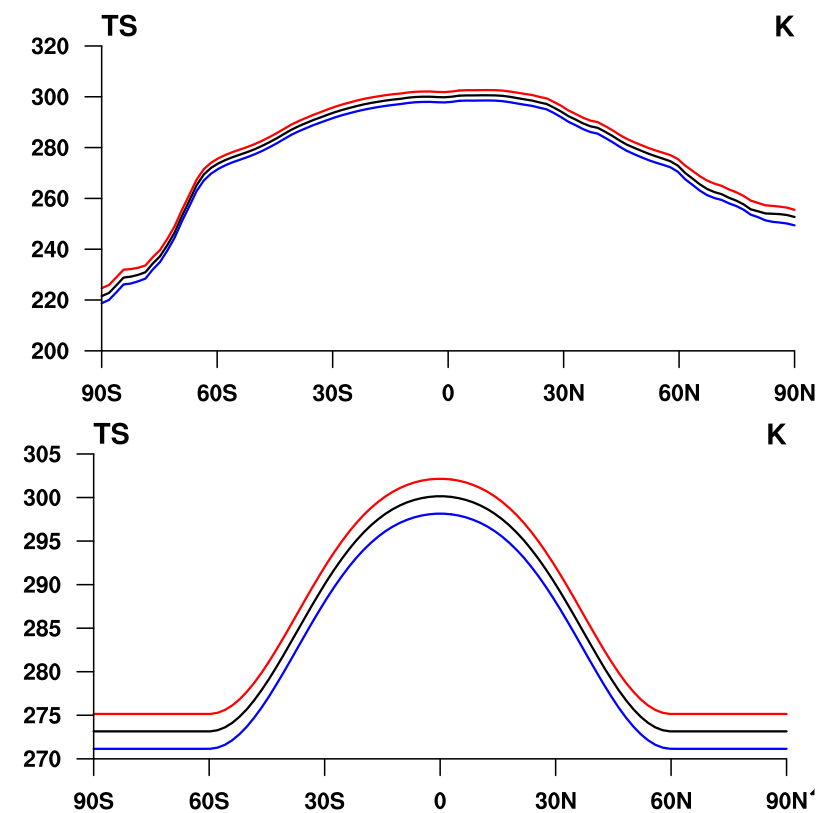

# The Experiments

Do newer versions of CAM (i.e., “v4” & “v5”) show the same pattern of response?

- ▶ Use CAM4 & CAM5, SST±2K experiments
- ▶ Both Earth-like and one Aquaplanet (“qobs”)

**CAM5: how to deal with the aerosol model?**

- ▶ Try the most naive thing first: prescribe zonal average emissions

# The Results

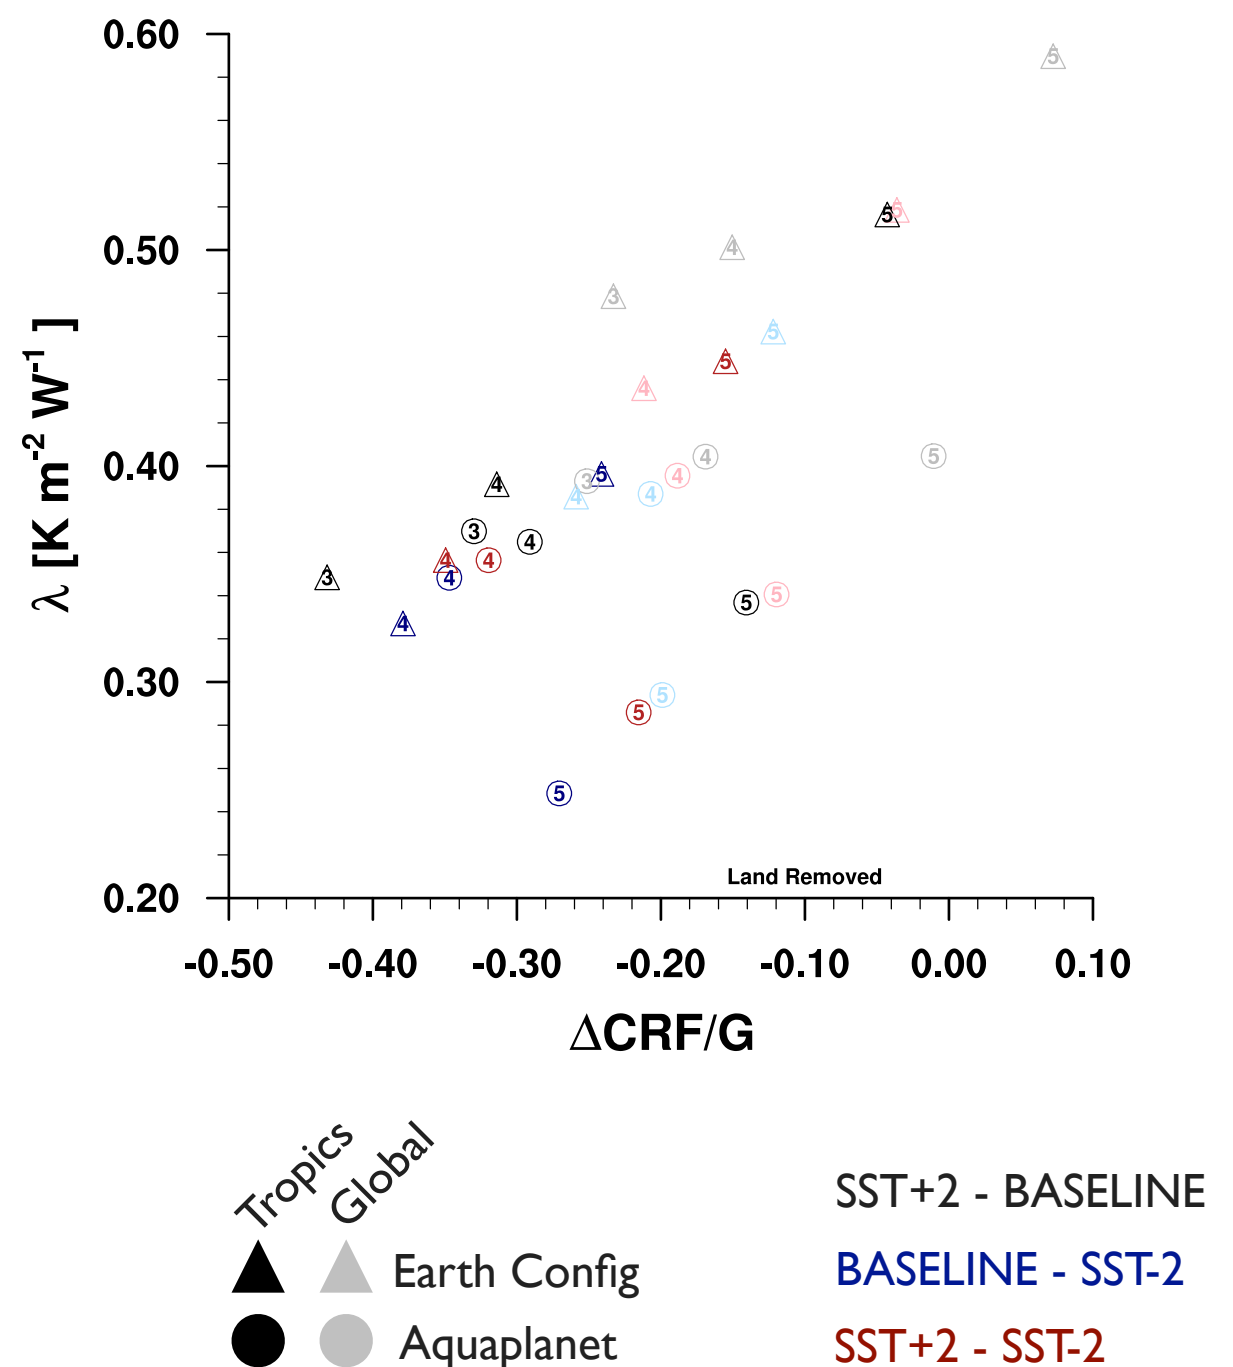

CAM 4 similar to CAM 3 in  $\lambda$  and  $\Delta\text{CRF}/G$

- ▶ Global & Tropics
- ▶ Earth & Aquaplanet

CAM 5 Earth more sensitive, weaker cloud effect

CAM 5 Aquaplanet is the outlier...

- ▶ stronger cloud response than Earth-config
- ▶ lower sensitivity

# The Results

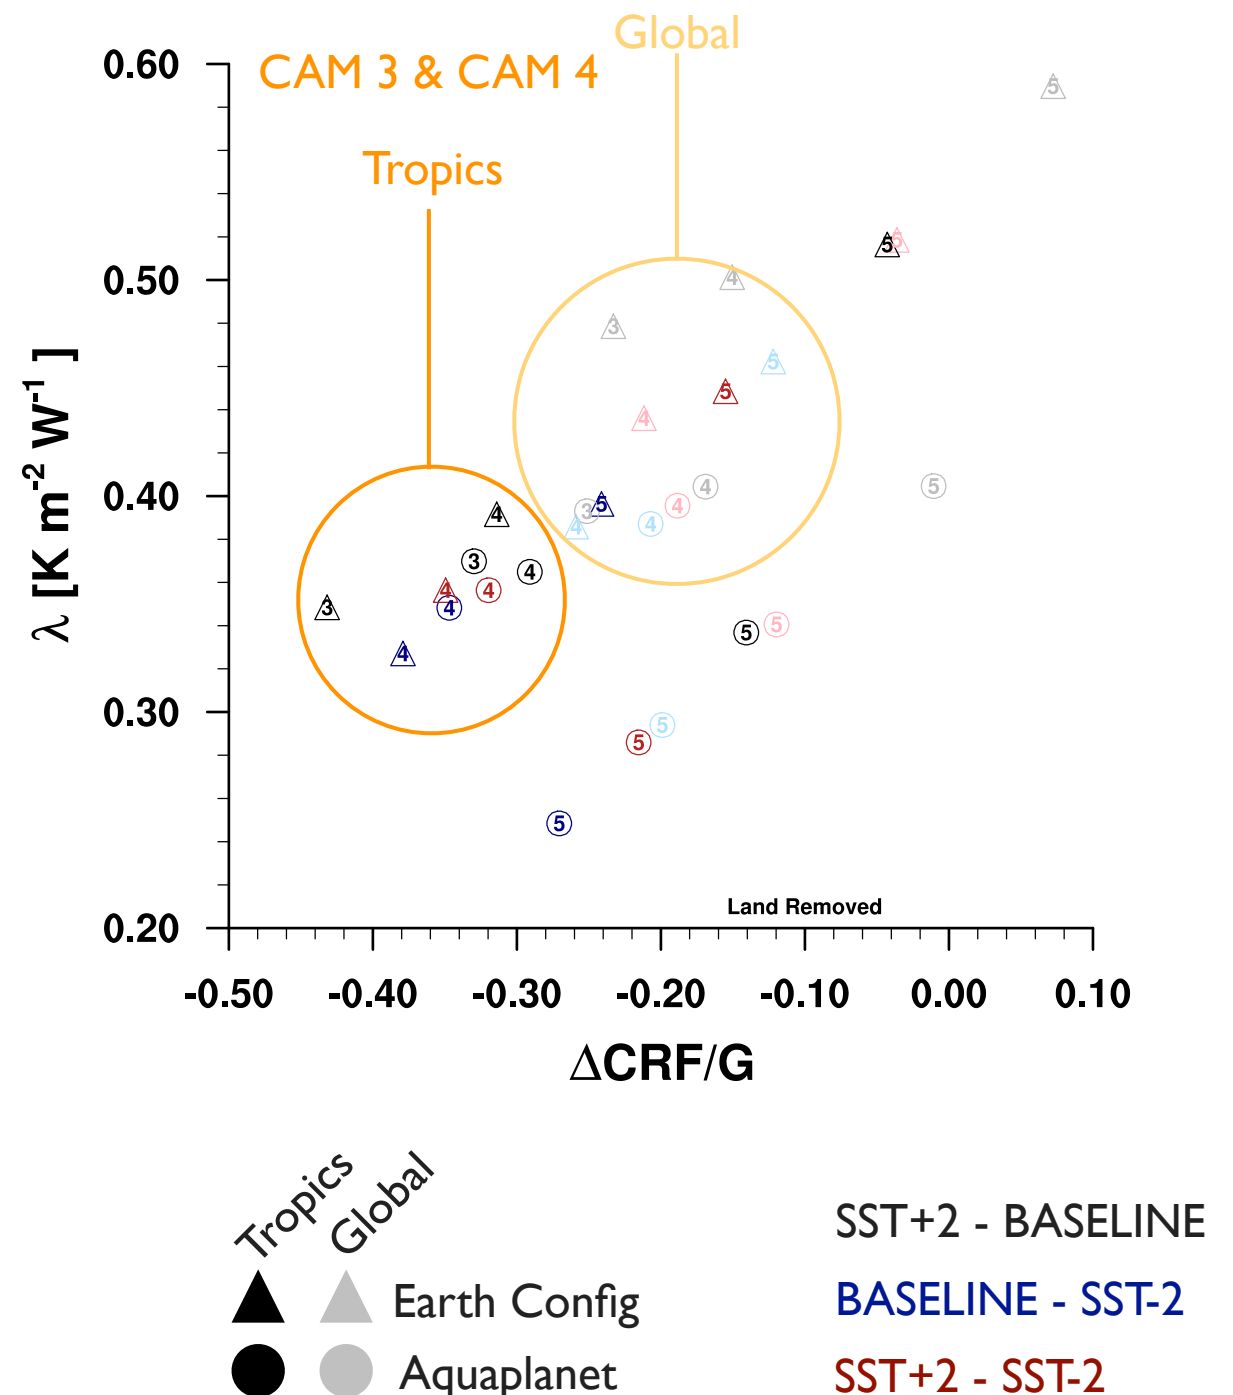

CAM 4 similar to CAM 3 in  $\lambda$  and  $\Delta\text{CRF}/G$

- ▶ Global & Tropics
- ▶ Earth & Aquaplanet

CAM 5 Earth more sensitive, weaker cloud effect

CAM 5 Aquaplanet is the outlier...

- ▶ stronger cloud response than Earth-config
- ▶ lower sensitivity

# The Results

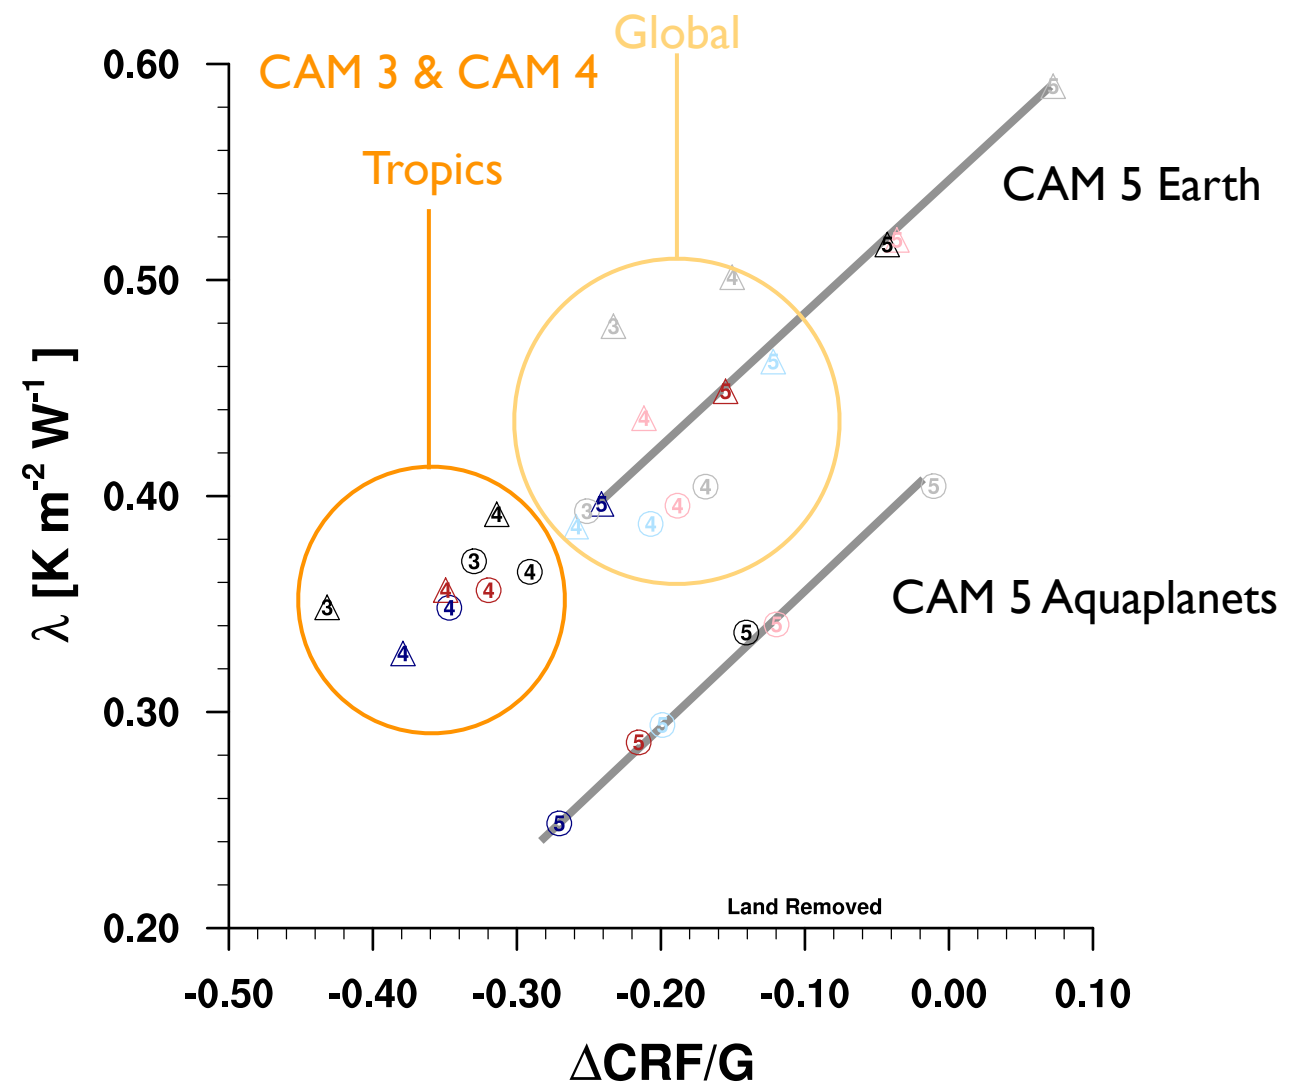

CAM 4 similar to CAM 3 in  $\lambda$  and  $\Delta\text{CRF}/G$

- ▶ Global & Tropics
- ▶ Earth & Aquaplanet

CAM 5 Earth more sensitive, weaker cloud effect

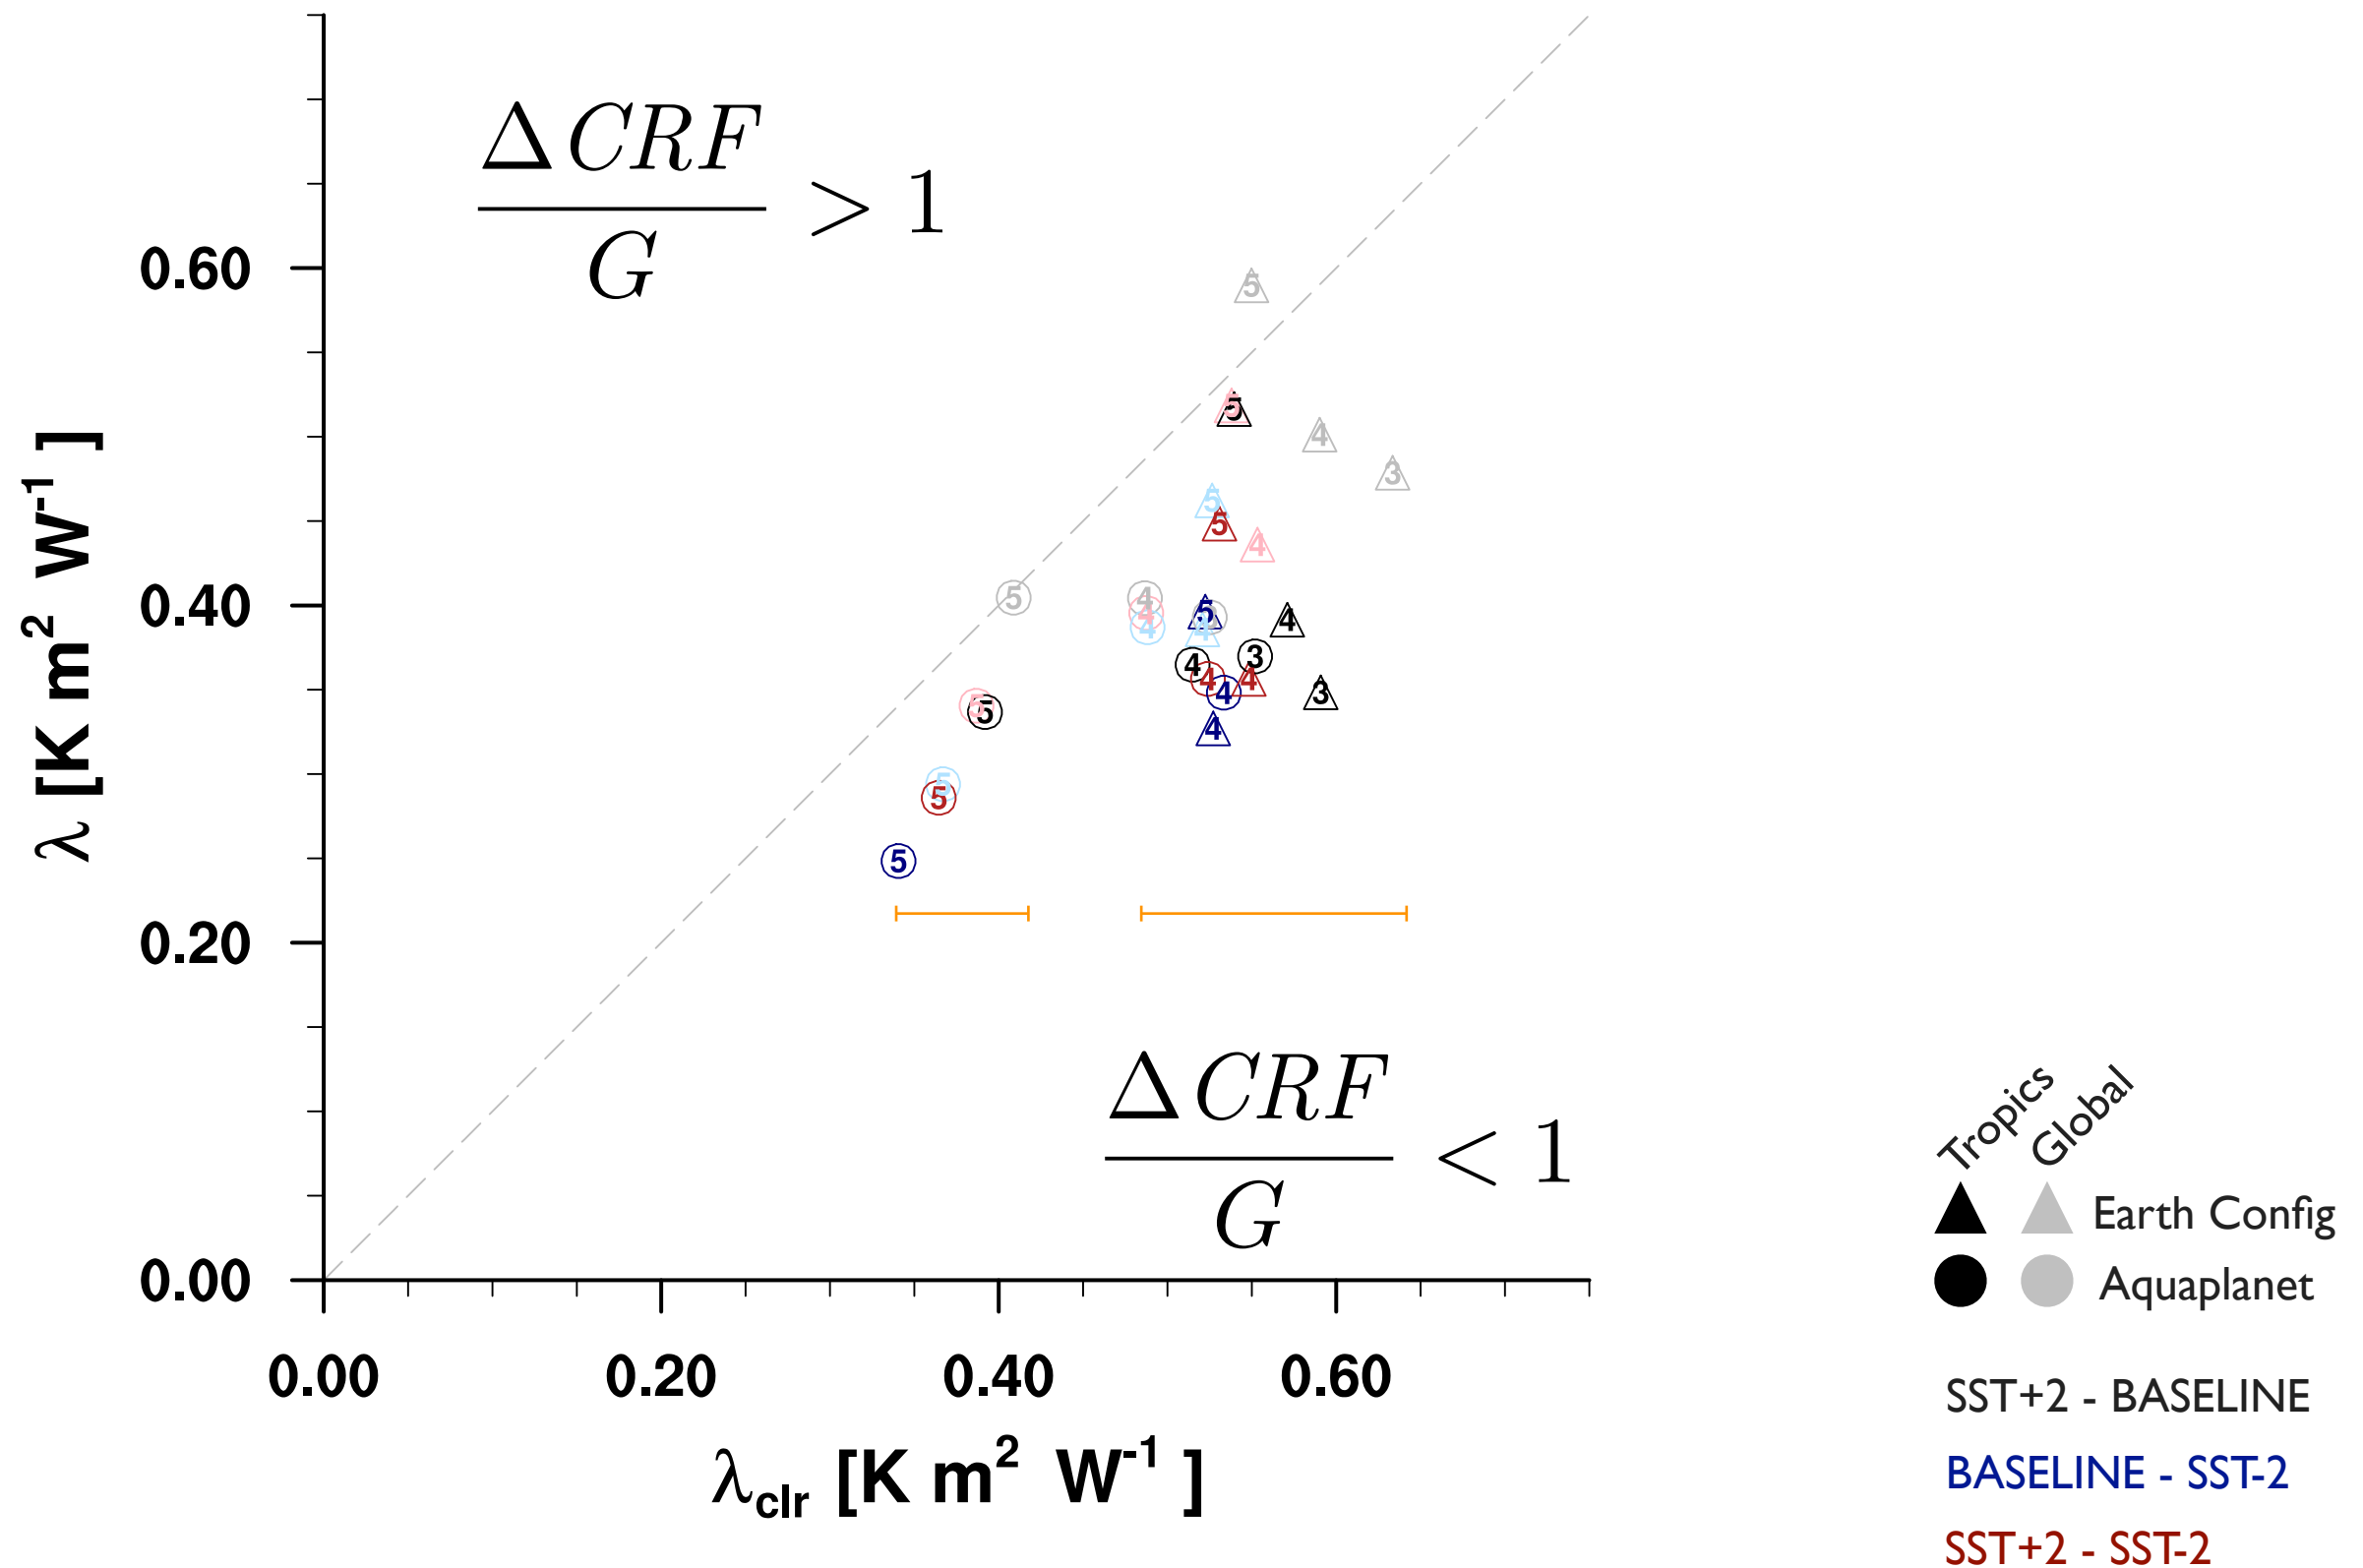

CAM 5 Aquaplanet is the outlier...

- ▶ stronger cloud response than Earth-config
- ▶ lower sensitivity

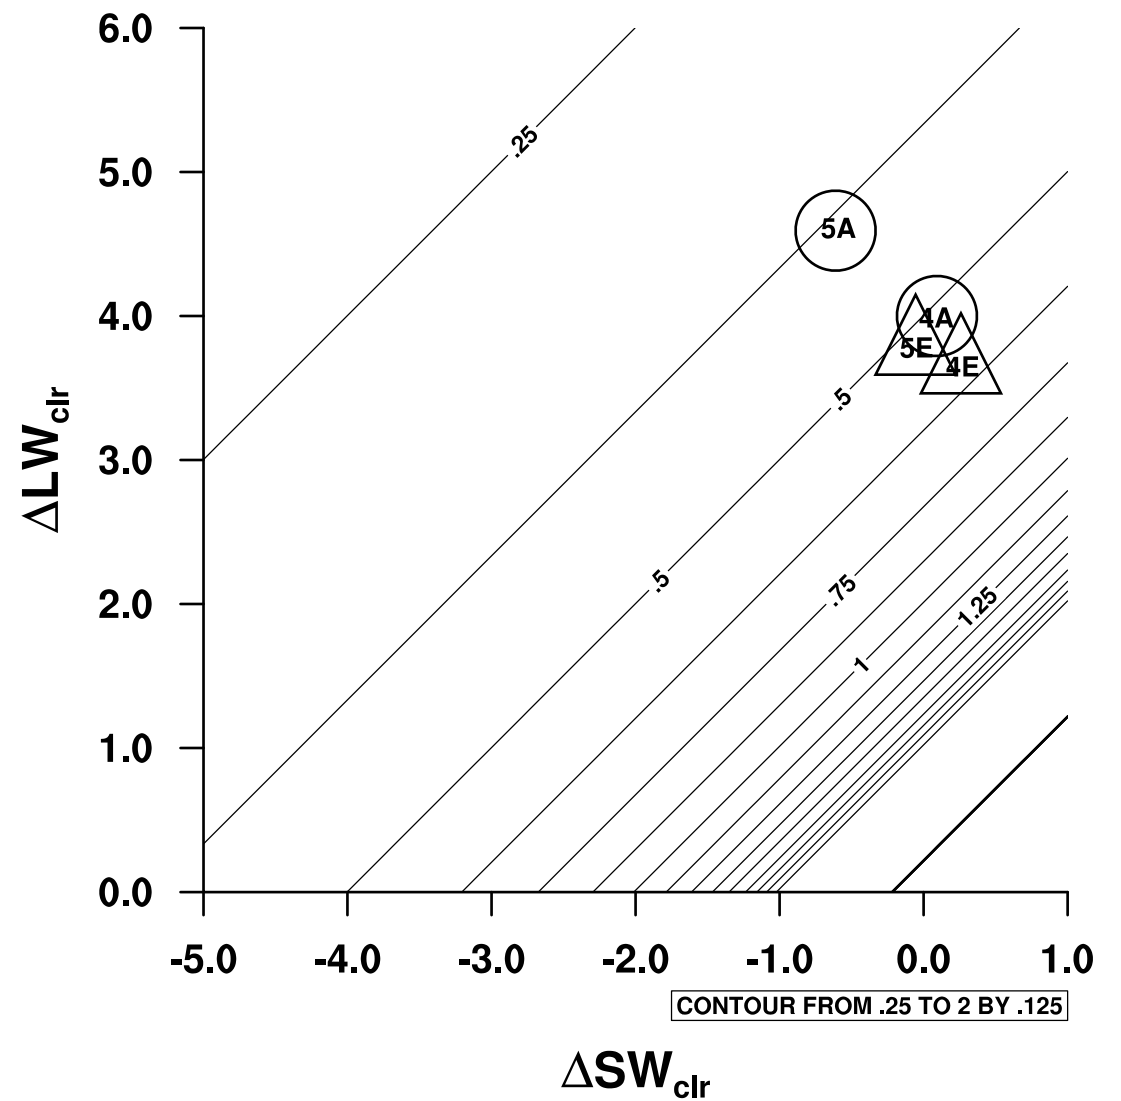

SST+2 - BASELINE  
BASELINE - SST-2  
SST+2 - SST-2

# Clear-sky effects

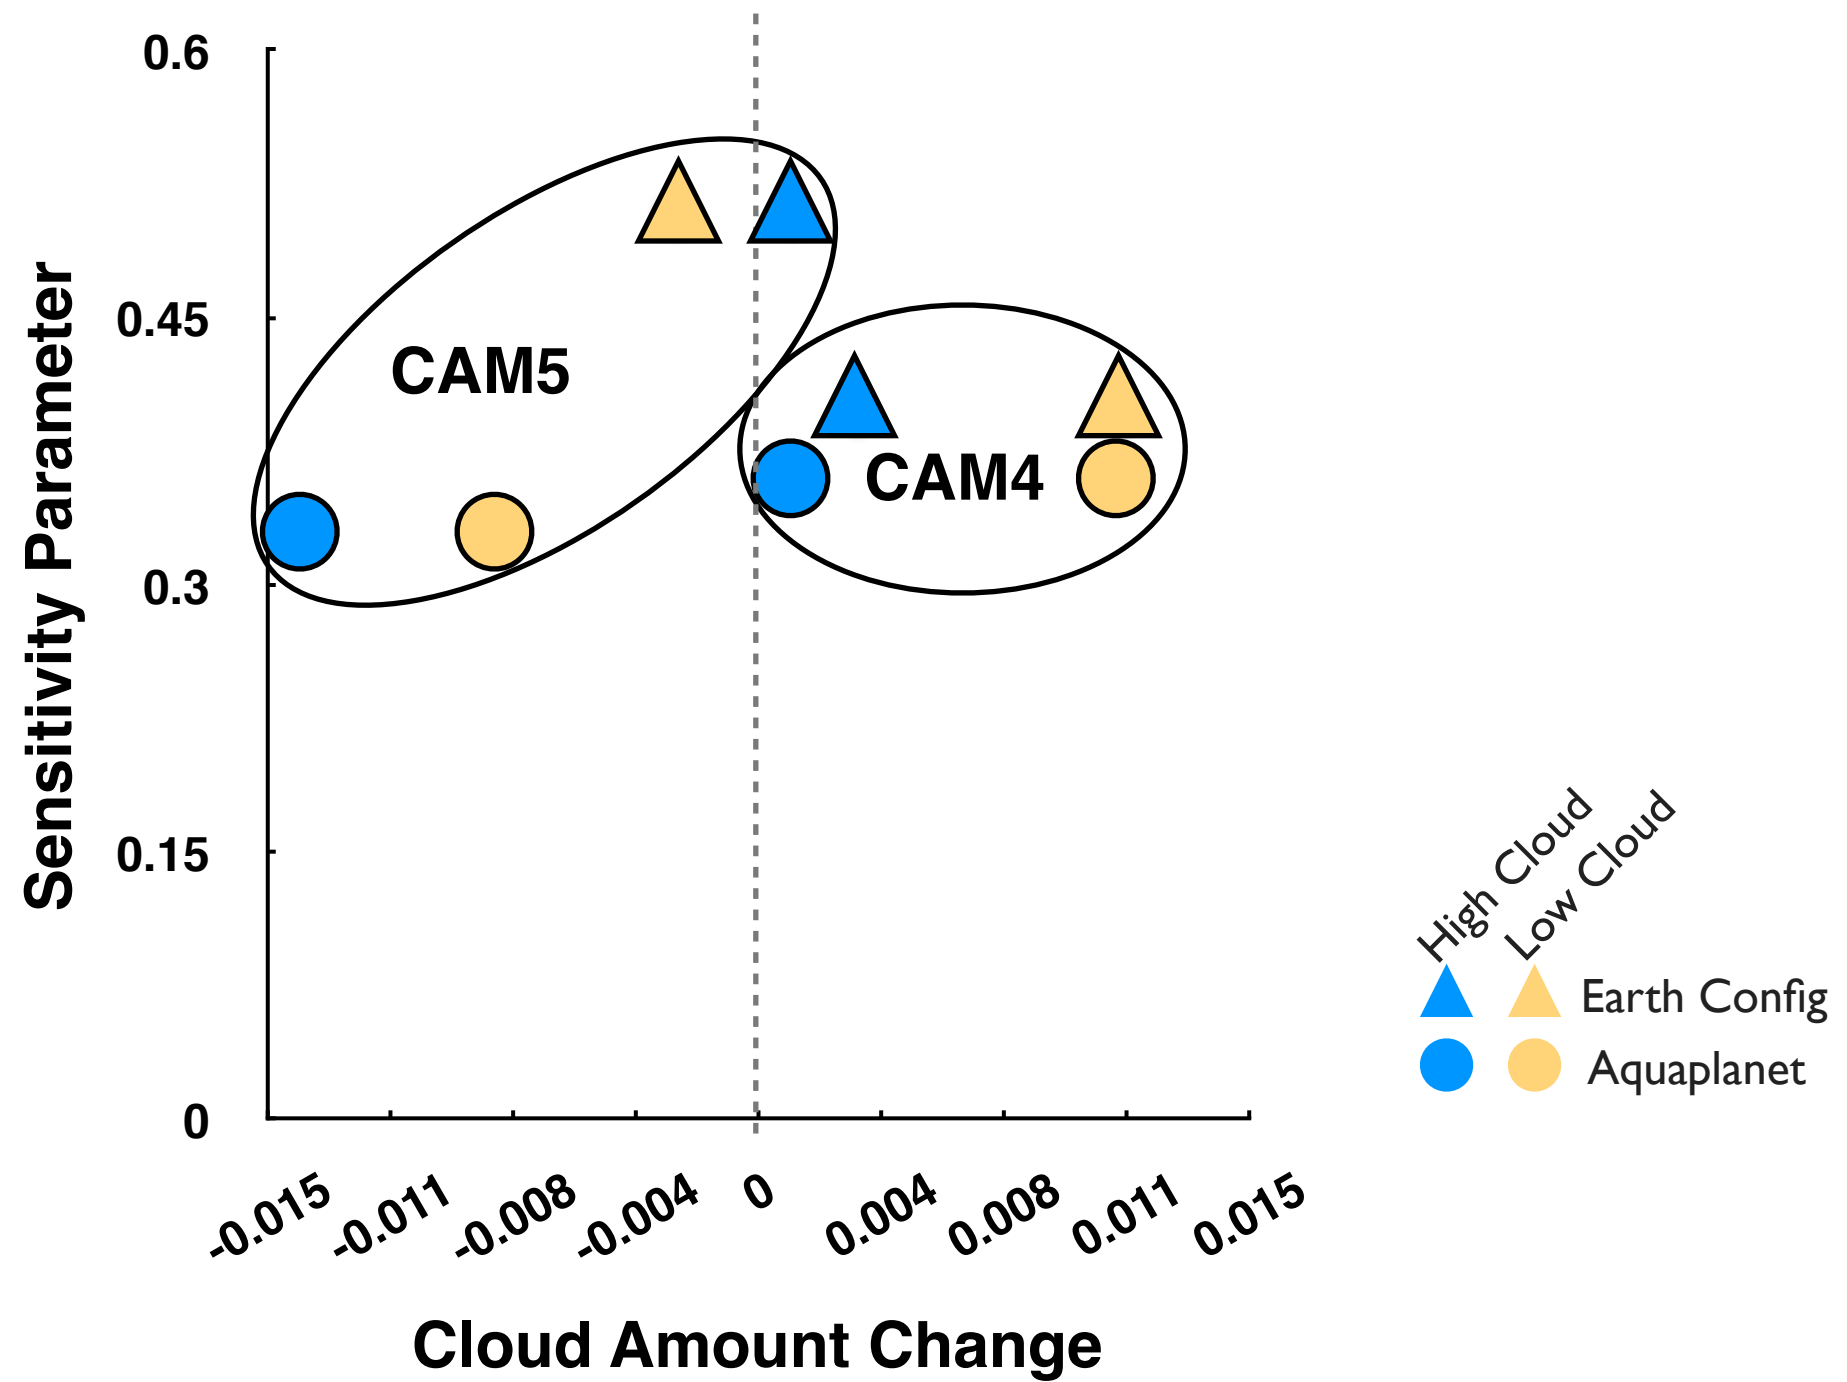

# TOA Components

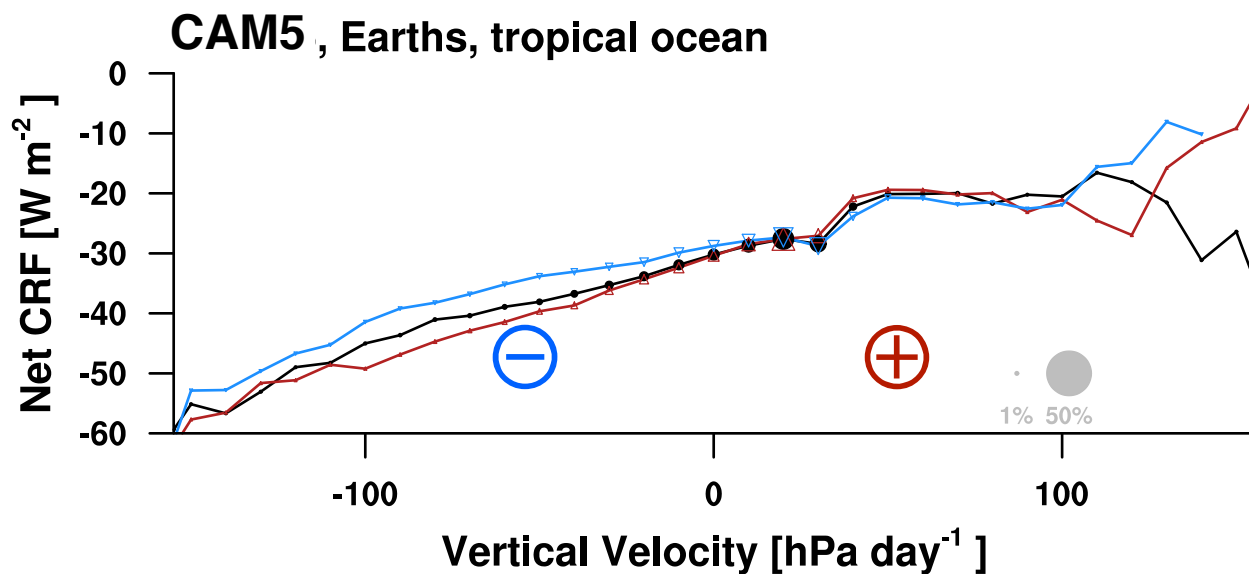

Contour lines show  $\lambda$  and  $\lambda_{clr}$

# Tropical Cloud Response

# $\omega_{500}$ Regimes, Net Cloud Forcing

Size of markers is frequency of occurrence (i.e., statistical weight).

# Conclusions?

CAM4 sensitivity and cloud response largely like CAM3

CAM5 aquaplanet has smaller  $\lambda$ ,  $\lambda_{\text{clr}}$  than Earth-like configuration

Appears to be influenced by clear-sky fluxes

- ▶ affects clear-sky sensitivity AND cloud radiative forcing, by construction
- ▶ Not all bad news: change in CRF is partitioned similarly by circulation regimes

Some possible directions:

- ▶ Investigate role of aerosol in this result (i.e., our naive experiment is probably naive)
- ▶ Turn off the aerosol model (in the works, and is probably the right way to do this)
