

WATER AND CLIMATE QUANTIFYING RISKS & UNCERTAINTY AN INTERMEDIATE APPROACH WITH AN INTEGRATED ASSESSMENT MODEL FRAMEWORK

ADAM SCHLOSSER, KEN STRZEPEK, WILL FARMER, SIREIN AWADALLA, XIANG GAO, AND JONATHAN BAKER

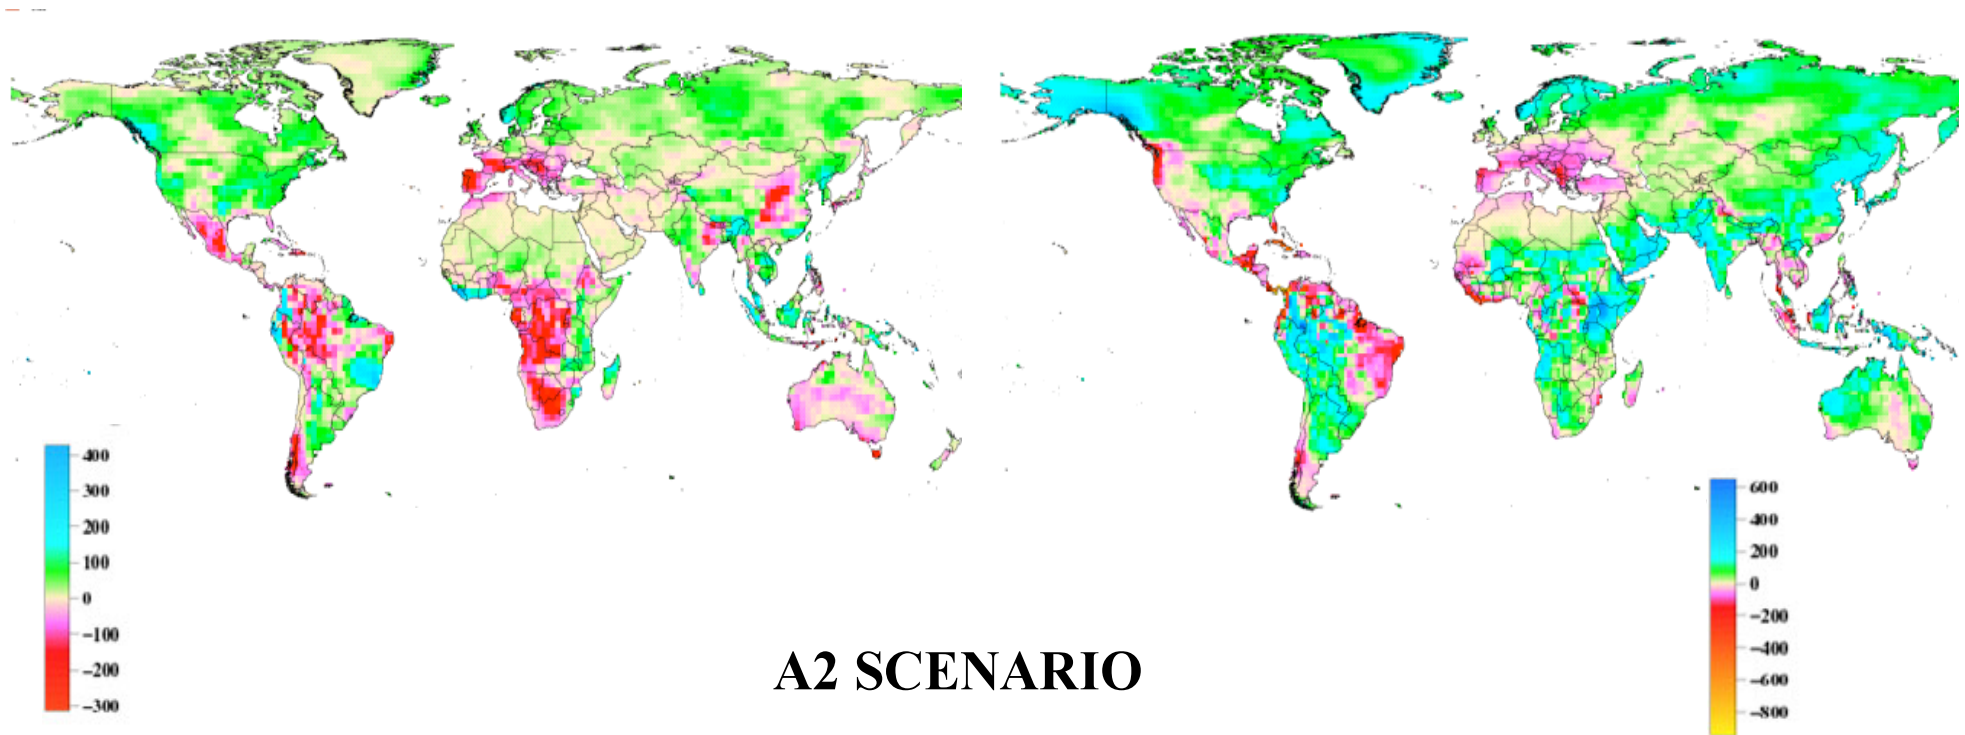

LMWG AND BGCW WORKSHOP, NCAR, FEB. 9, 2010

Adapt to what? – Global Wet and Dry

Change in average annual precipitation, 2000 – 2050

CSIRO (DRY)

NCAR (WET)

A2 SCENARIO

Two extreme GCMs used to estimate range of costs

IGSM SCENARIOS

(SOKOLOV ET AL., 2009, AND WEBSTER ET AL., 2010)

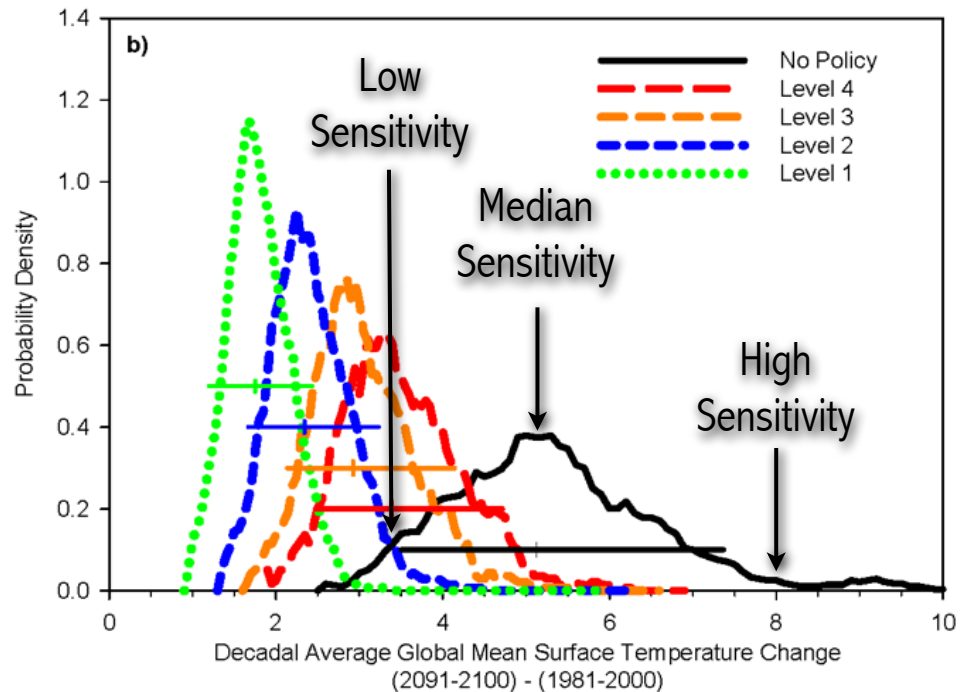

NO POLICY (REFERENCE):

- CLIMATE & EPPA SAMPLES

POLICY SCENARIOS:

REPRESENTATIVE CONCENTRATION PATHWAYS (RCPs)

- U.S. CCSP LEVEL 4
- U.S. CCSP LEVEL 3
- U.S. CCSP LEVEL 2
- U.S. CCSP LEVEL 1

RUN 400 MEMBER ENSEMBLES USING LATIN HYPERCUBE SAMPLING FOR EACH POLICY

METHODOLOGY, PHILOSOPHY, PROOF OF EFFORT

- EXTRAPOLATION: OF GCM PATTERNS - HOW TO CHARACTERIZE?
 - METHODS OUT THERE... SO WHERE'S THE QUANTUM LEAP?
- CONSISTENCY:
 - DO THE IGSM AND GCMs AGREE ON THE ZONAL TRENDS?
- PLAUSIBILITY:
 - CAN/SHOULD WE FILTER OUT CERTAIN GCMs, HOW?
 - IMPACT ON RESULTING REGIONAL PDFs?
- PROVISIONAL APPLICATION TO WATER-RESOURCE RISKS

METHODS TO GET 3D FROM (\leq) 2D

- 0-ORDER: ASSUME NO CHANGE IN PATTERNS FROM CLIMATOLOGY
- 0.5-ORDER: PICK ONE GCM AND RUN WITH IT... BUT WHICH ONE DO YOU BELIEVE MORE?
- 0.75-ORDER: TAKE THE AVERAGE OF SOME GCMs... SMOOTH OUT PEAKS (HIGH RISK)
- 1ST-ORDER: CONSIDER “ALL” EQUALLY PLAUSIBLE.
 - SCENGEN: SIMILAR... DRIVEN BY MAGICC (0-ORDER GLOBAL ENERGY BALANCE MODEL)
 - COSMIC: PICK GCM, C_s (CLIMATE SCALING FACTOR), AND EMISSIONS SCENARIO (BOTH GHG AND SULPHATE), DONE BY COUNTRY
 - MERGE: BASED ON 1D DAMAGE FUNCTIONS
 - THESE METHODS ARE 1D (I.E. GLOBAL) TO 3D... AND NO FEEDBACKS.
- **1.5-ORDER: FILTERED SELECTION (ZONALLY-BASED FOR IGSM)**
- 2ND-ORDER: PROBABILISTIC-CONDITIONAL SELECTION W/ TIME-VARYING ELASTICITIES.
- “3RD-ORDER”: EXPLICIT REGIONAL CLIMATE CHANGE PROBABILITY VIA 3D GCM OR RCM.

GROUPS DOING SOMEWHERE BETWEEN 0 AND 1ST-ORDER

Merging Regional Climate Uncertainty in the IGSM Framework

IGSM

90°N

$$C_{x,y}^{(AR4 \text{ or } OBS)} = \frac{V_{x,y}^{(AR4 \text{ or } OBS)}}{\bar{V}_y^{(AR4 \text{ or } OBS)}}$$

$$V_{x,y}^{IGSM} = C_{x,y} \bar{V}_y^{IGSM}$$

Use observed variables for $C_{x,y}$ climatology of:

- Temperature (CRU: surface air temperature)
- Precipitation (GPCP: satellite and ground)

Use AR4 archive of 2xCO₂ runs to estimate:

- $C_{x,y}$ trends
- 19 GCM simulations available

Construct probabilistic sample of potential future $C_{x,y}$ trends from AR4 projections

90°S

\bar{V}_y^{IGSM}

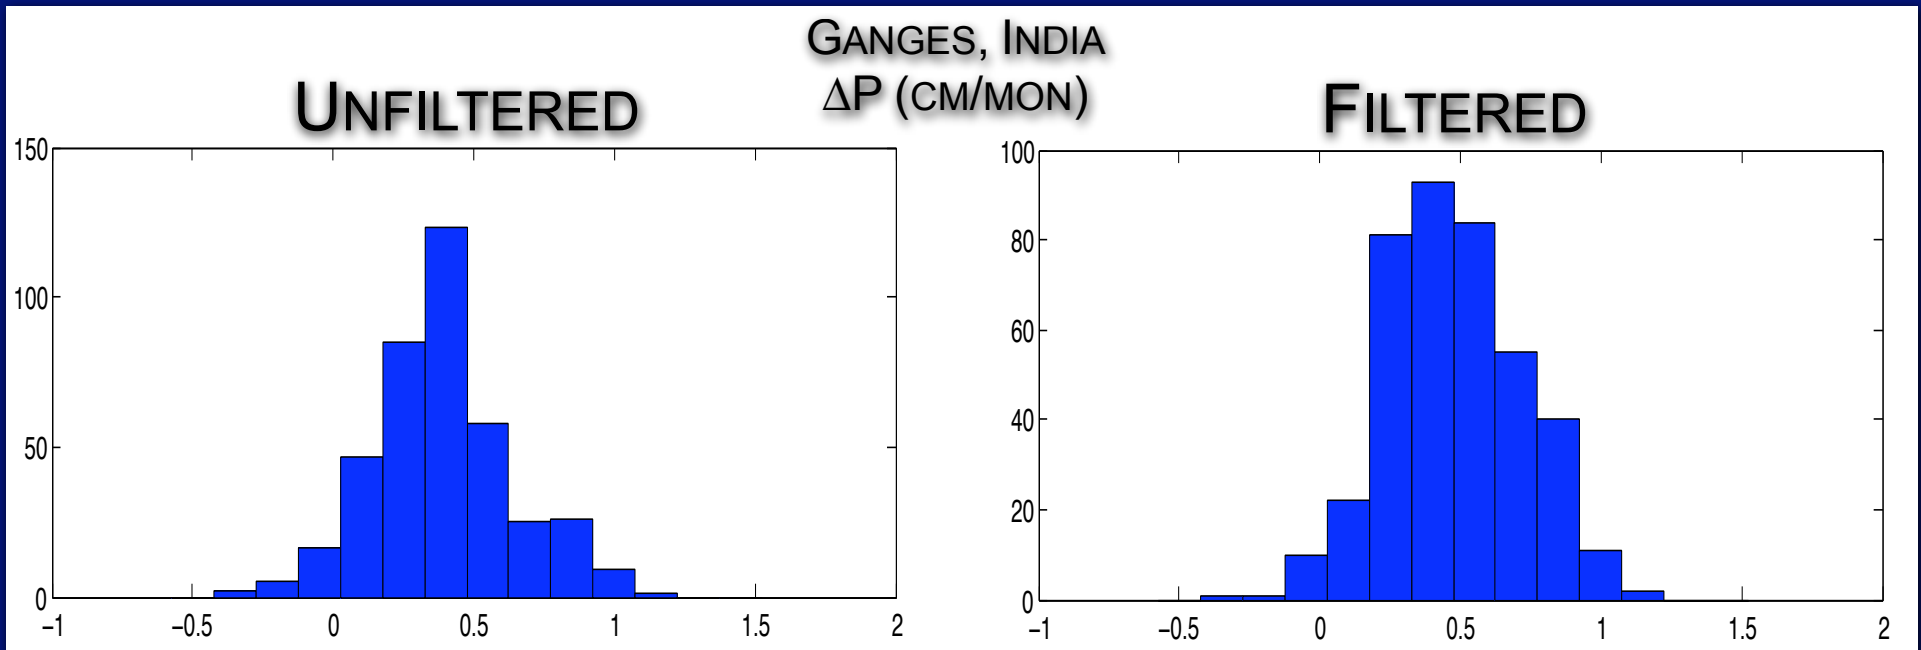

IGSM2-G

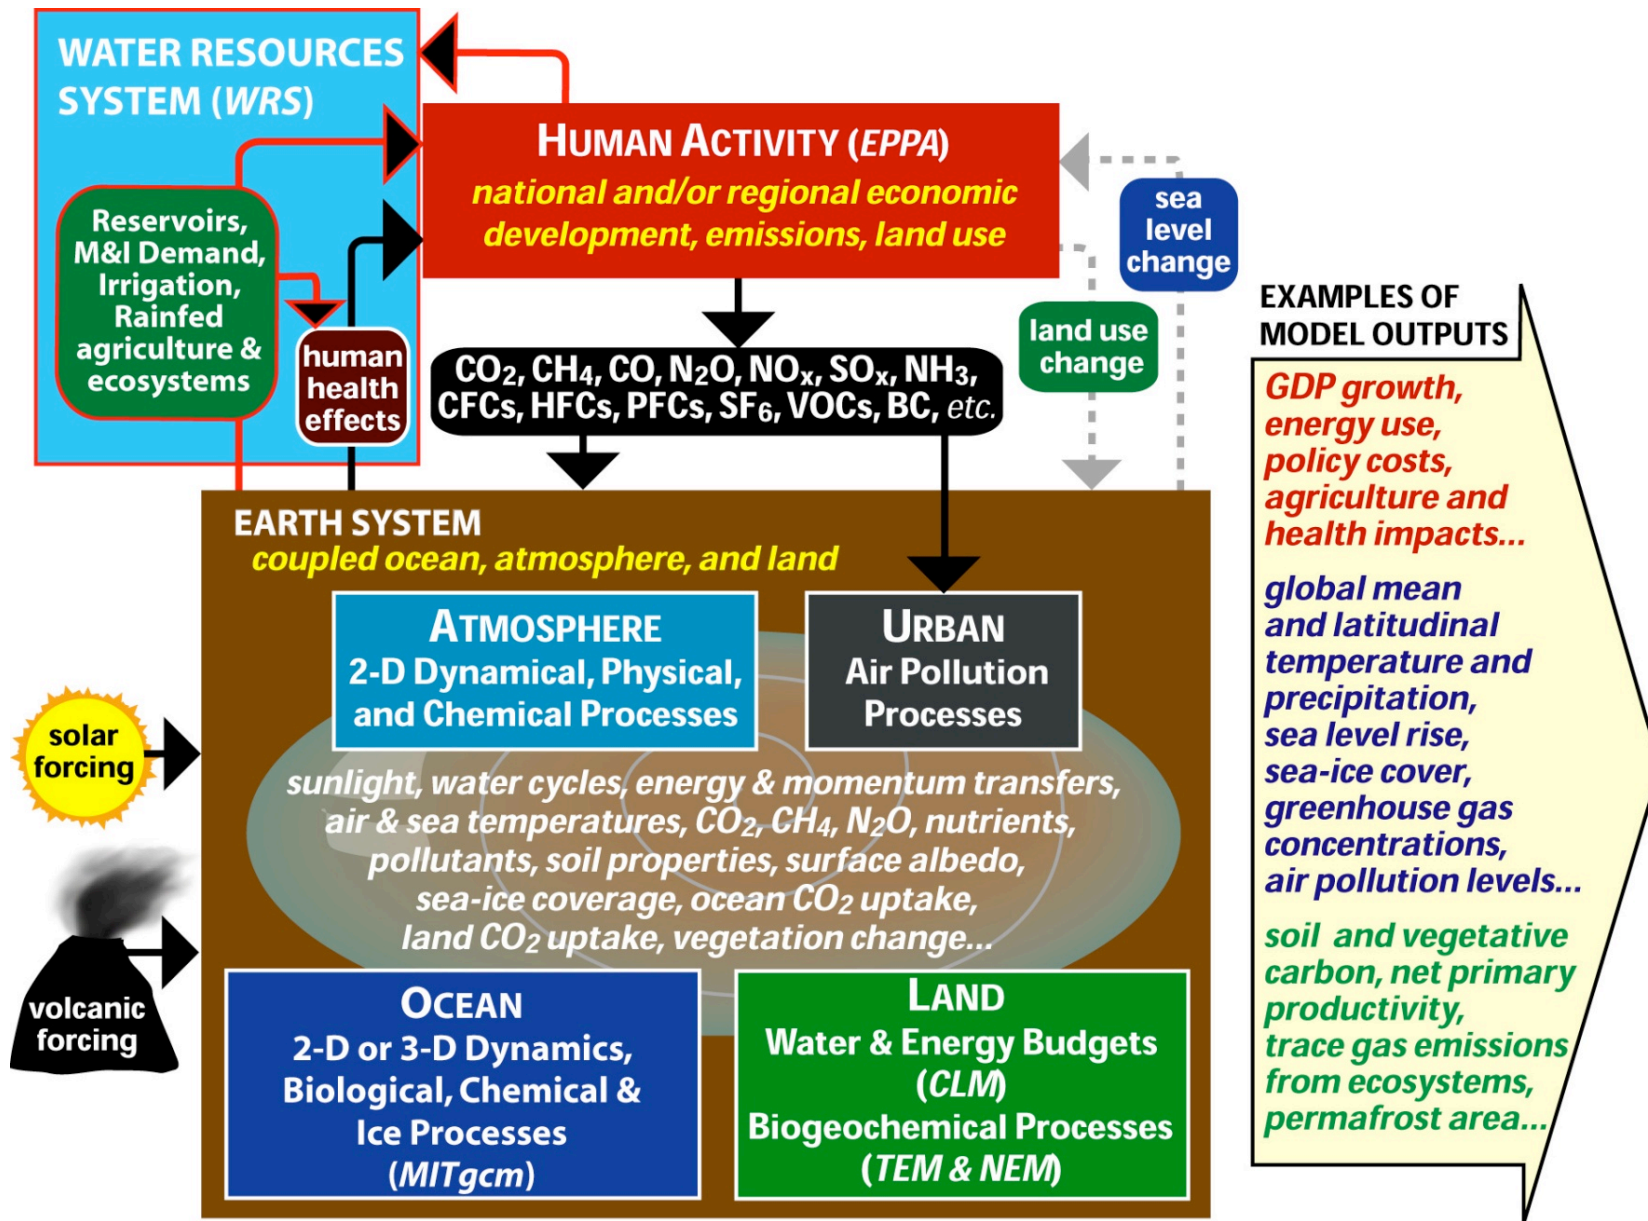

$$V_{x,y}^{IGSM} (\Delta T_{Global}^{IGSM}) = C_{x,y}^{OBS} \bar{V}_y^{IGSM} + \left[\frac{dC_{x,y}^{AR4}}{dT_{Global}} \Delta T_{Global}^{IGSM} \right] \bar{V}_y^{IGSM}$$

SELECTION & FILTERING OF GCM PATTERNS

- Initially, all GCM patterns assumed equally probable.
- Filtering Philosophy: Cannot fuse a GCM pattern whose zonal trends do not match the IGSM.
 - Doesn't necessarily indicate GCM is “wrong” - just not consistent
 - Tested criterion on a seasonal and annual basis.

Water Resource System in IGSM

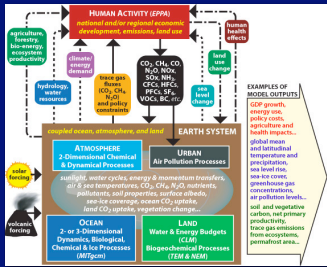

THE MIT INTEGRATED GLOBAL SYSTEM MODEL VERSION 2

(IGSM2: SOKOLOV ET AL., 2005, JP REPORT #124 EPPA: PALTSEV ET AL. 2005, JP REPORT #125 LAND: SCHLOSSER ET AL., 2007 JP REPORT #147 OCEAN: DUTKIEWICZ ET AL., 2005, JP REPORT #122, URBAN: COHEN AND PRINN, 2009, JP REPORT #181)

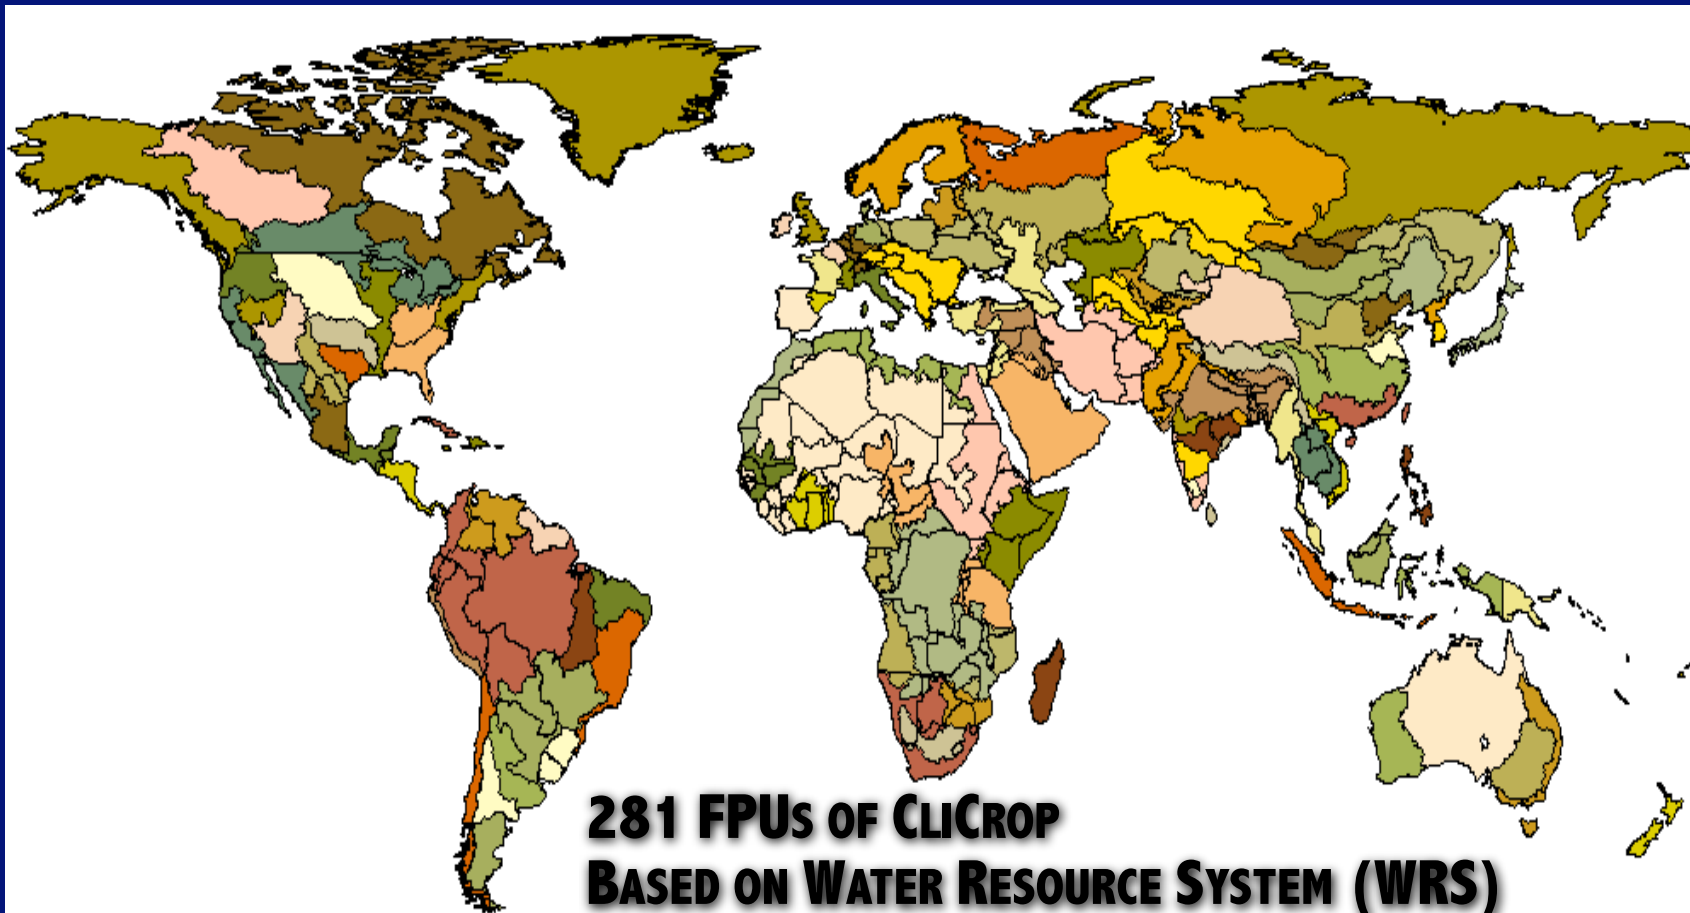

Simulation Experiments IGSM-CliCrop

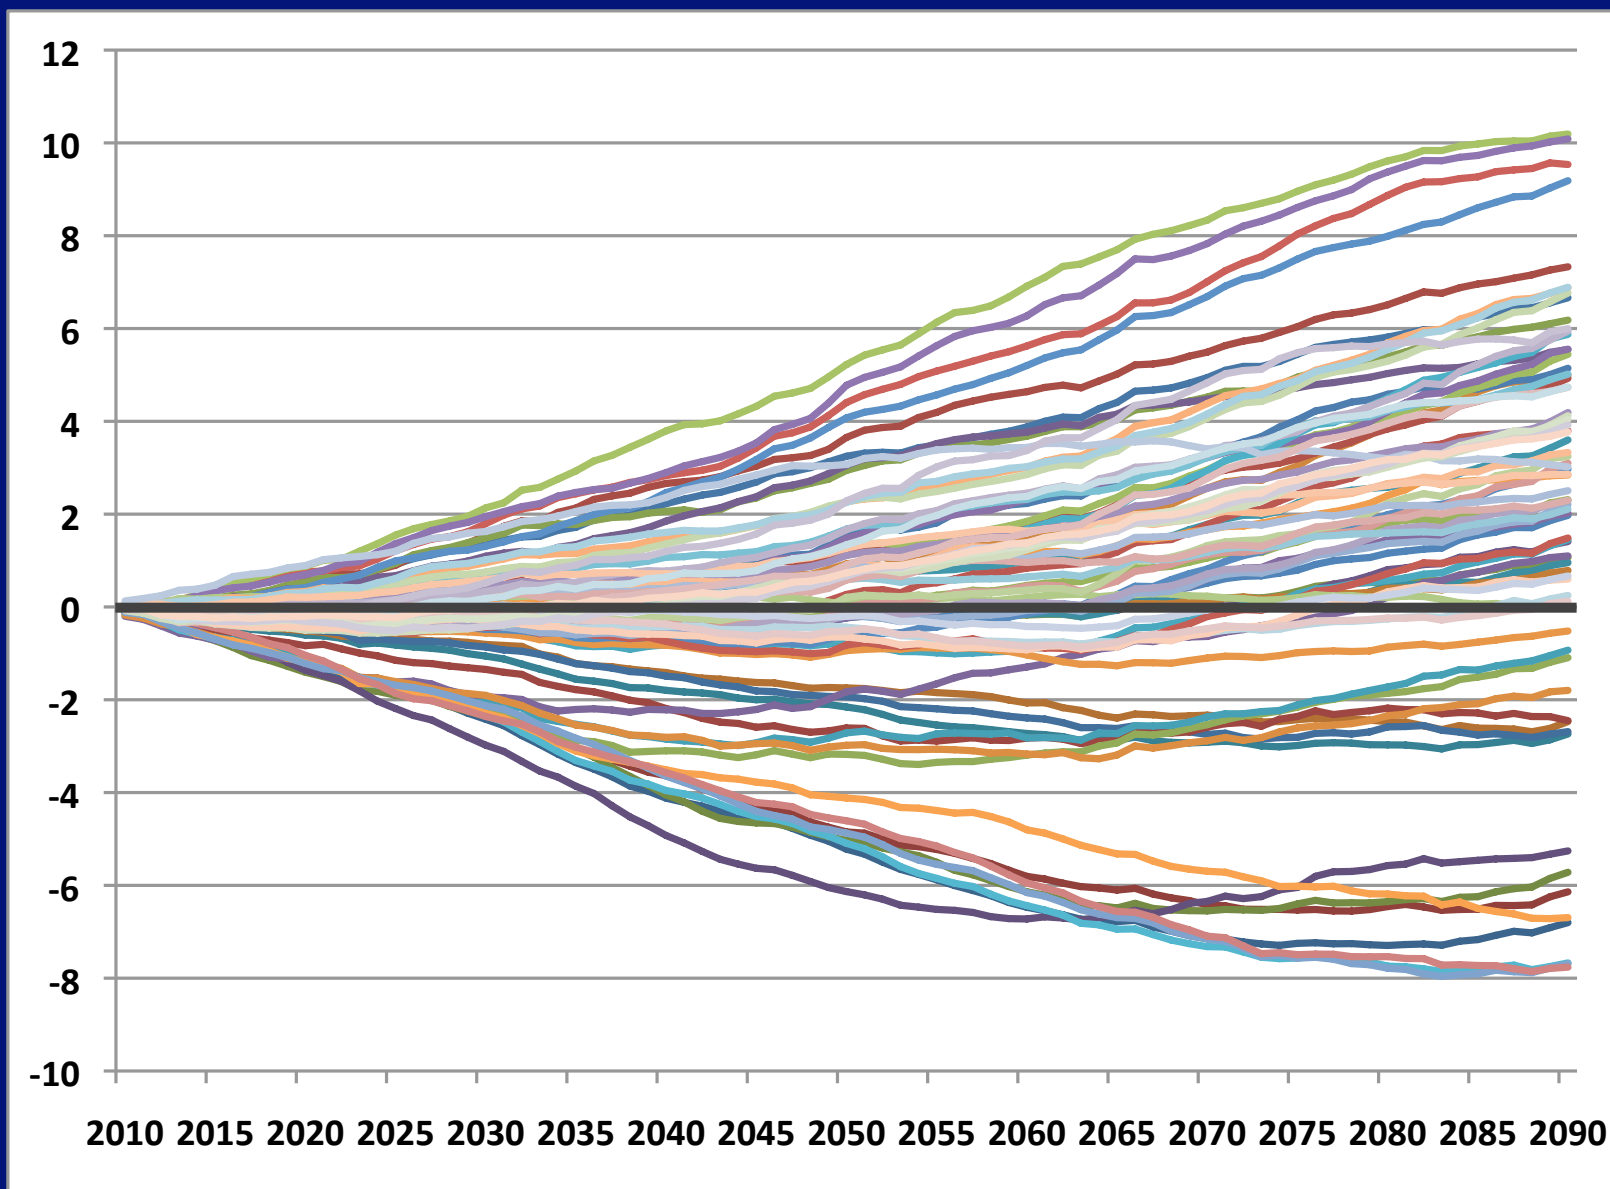

- IGSM2 “No Policy” ENSEMBLES (WITH 400 MEMBERS) CONSIDERED.
- EACH GCM ASSUMED EQUAL PLAUSIBILITY (RANDOM PICK OF FILTERED GCMs).
- CLICROP RUN GLOBALLY AT 2° X 2° SPATIAL RESOLUTION.
- SIMULATION PERIOD: 2000-2100 (USING THE IGSM2 PROJECTIONS).
- CLICROP SIMULATIONS EXECUTED FOR MAIZE. OTHER CROPS WILL FOLLOW.
- TOTAL AREA OF RAINFED AND IRRIGATED CROPS KEPT CONSTANT IN TIME.
- CHANGES IN AGRICULTURAL TECHNOLOGY NOT CONSIDERED IN THIS EXERCISE.

AGGREGATE CLICROP FOOD PRODUCING UNITS (FPUs)

- PRELIMINARY ANALYSIS/RESULTS FOR TWO LARGE AGRICULTURE FPUs:
 - **INDIA GANGES: ONE OF LARGEST IRRIGATED CROP AREAS**
 - **SOUTH AFRICA EAST/WEST CAPE : ONE OF LARGEST RAIN FED CROP AREAS**
 - **NILE/ETHIOPIA AND MISSOURI RIVER BASIN**

South Africa: Change in Rain Fed Maize Yield (%)

LMWG/BGCWG Meeting, Feb. 9, 2010

INDIA GANGES

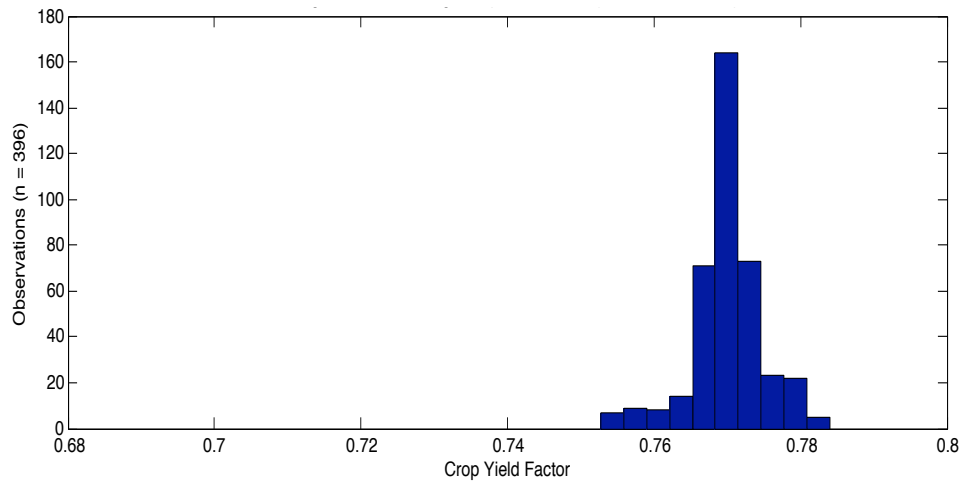

CHANGE IN IRRIGATION DEFICIT (10^6 GAL/YEAR)

PDFs of CHANGES

GANGES, INDIA

AVERAGE CROP YIELD FACTOR
(2000-2009)

ΔP (CM/MON): 21ST CENTURY CHANGE

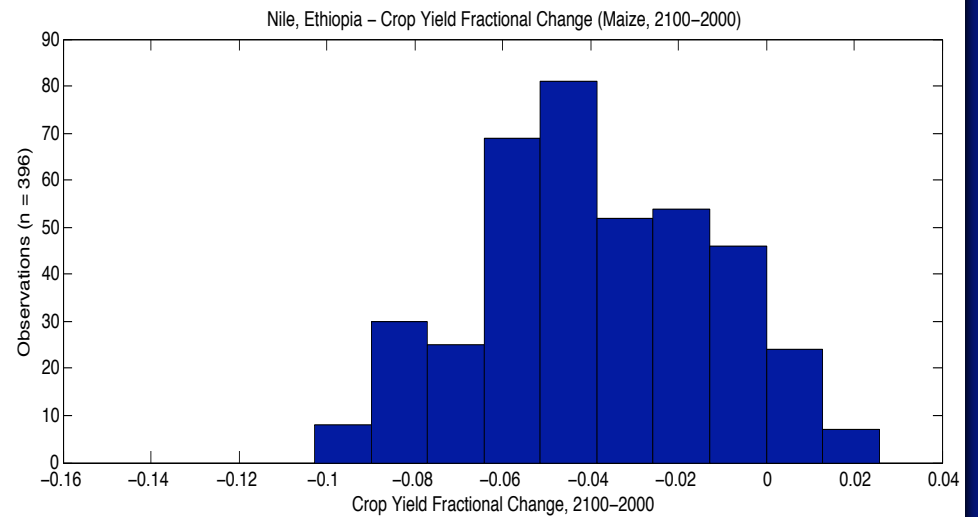

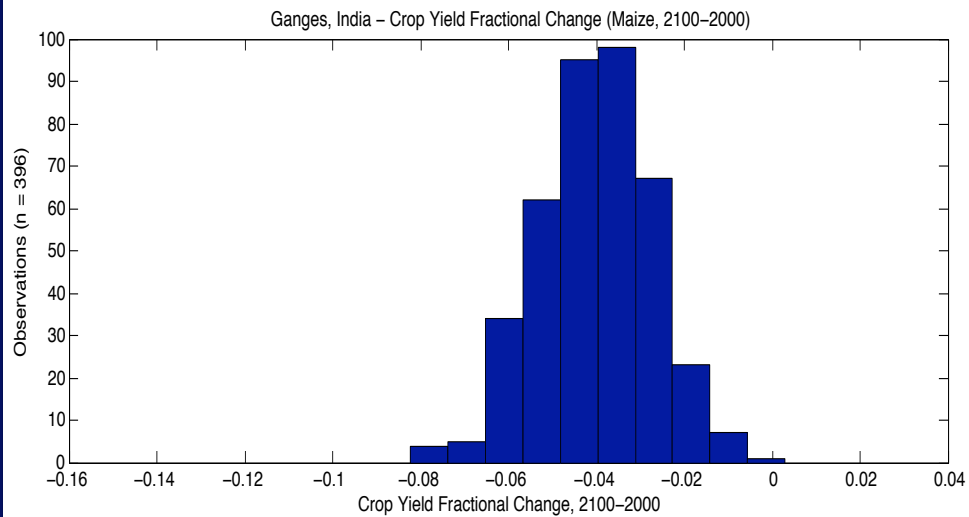

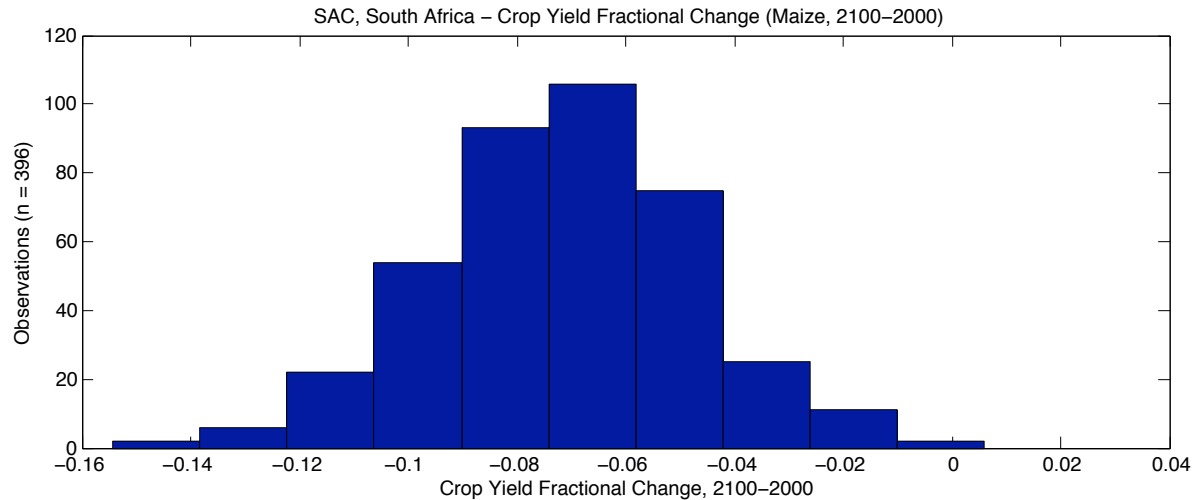

ΔT ($^{\circ}$ K): 21ST CENTURY CHANGE

- Which wins out for Ganges, increased P or increased T?

PDFs of Crop Yield Change

CLOSING REMARKS

- IN THESE PRELIMINARY RUNS WITH THE EXTRAPOLATED NO-POLICY, WE SEE TREND REVERSALS IN CROP (FOR NOW, MAIZE) PRODUCTIVITY & IRRIGATION DEMAND
- PDFs SHOW THAT ΔT 'S WIN OUT OVER ΔP 'S FOR BASINS CONSIDERED.
- NEAR TERM:
 - REFINE HYBRID REGIONAL PDFs OF ΔT 'S AND ΔP 'S
 - EXPAND CROPS AND LINK PUBLIC, INDUSTRIAL, HYDROELECTRIC WATER
 - ENSEMBLES (IGSM POLICY PLUS GCM PATTERNS)
- LAND USE CHANGE:
 - RENEWABLES (NREL) AND BIOFUELS AT LARGE-SCALE
