

Parameterization of the Ice Cloud Mass-weighted Fall-speed Using In Situ Data from Recent Field Campaigns

David L. Mitchell and Subhashree Mishra
Desert Research Institute, Reno, Nevada

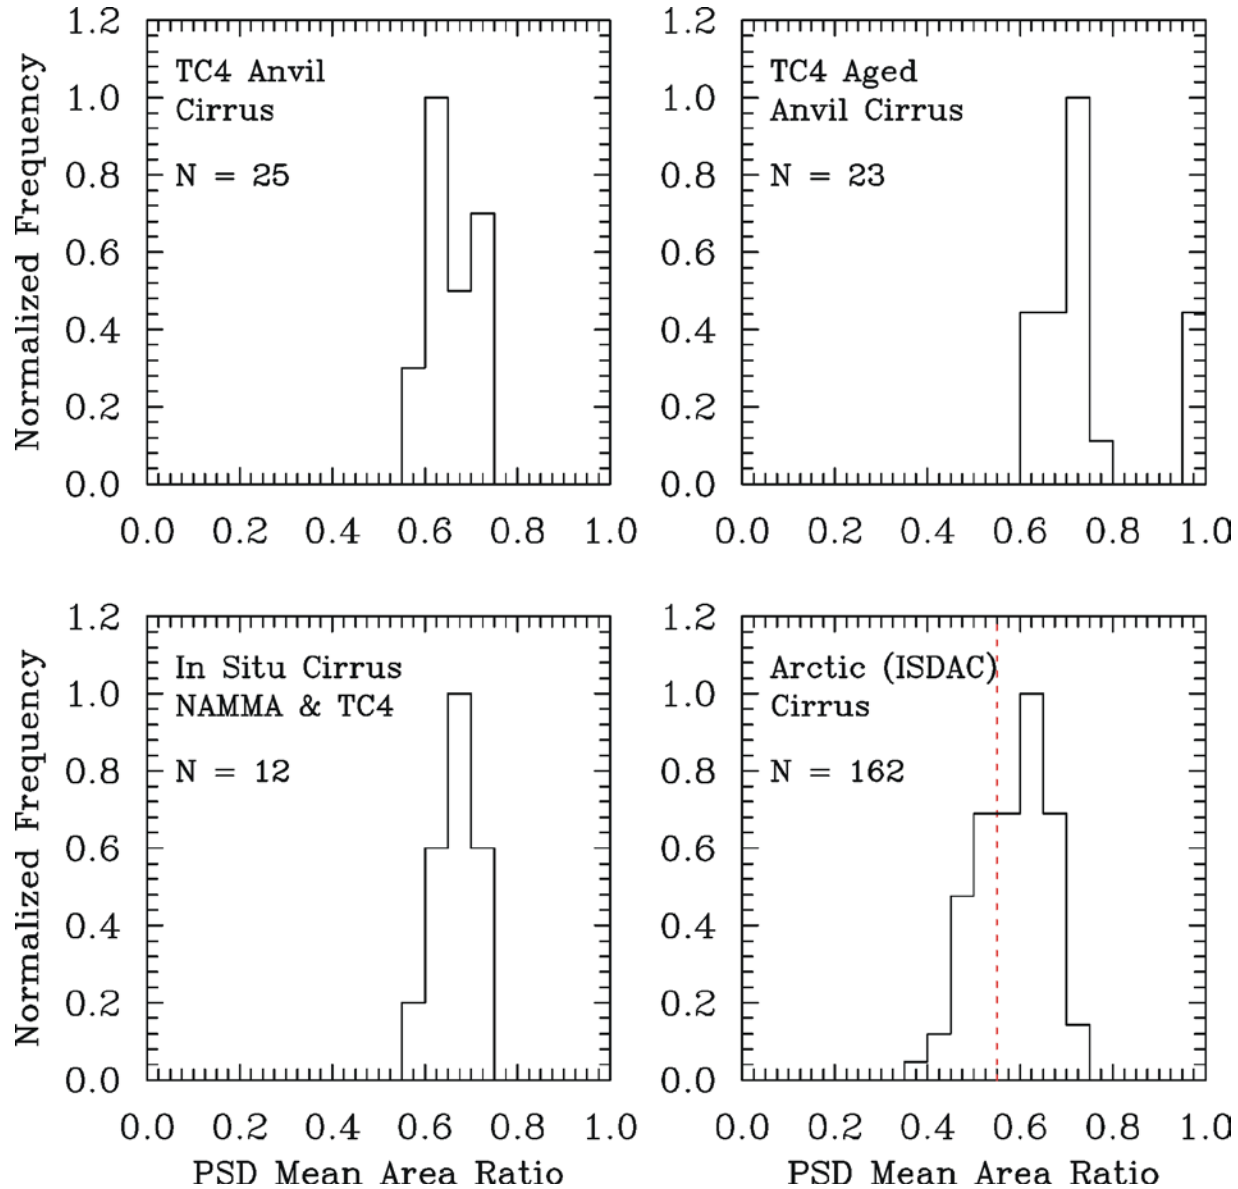

R. Paul Lawson and Brad Baker
SPEC, Inc., Boulder, Colorado

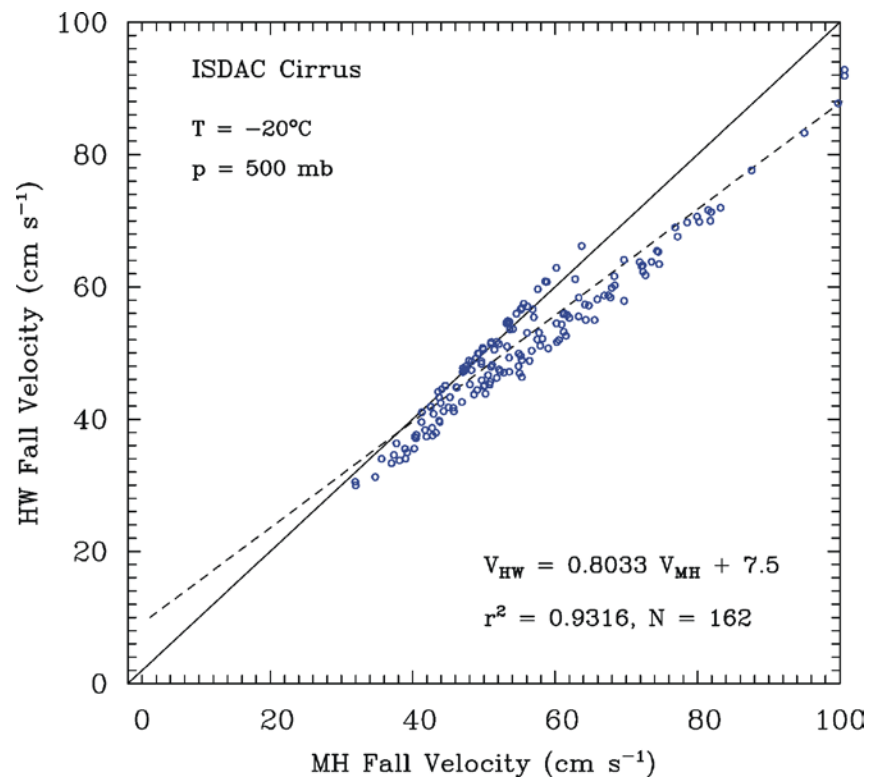

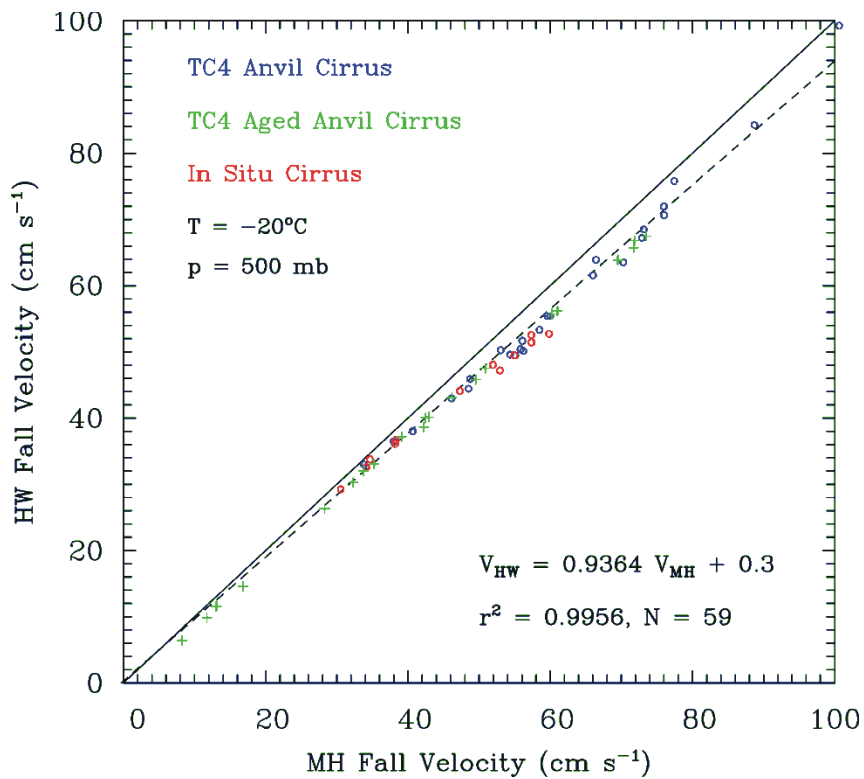

Arctic cirrus crystals have different area ratios

GENERAL APPROACH

1. The size resolved 2D-S measurements of number, projected area and mass concentration appear reasonable.

- Ice artifacts from shattering greatly reduced
- Good agreement between 2D-S and CVI IWC during TC4

2. Therefore calculate V_m and D_e **directly** from these measurements:

$$V_m = \sum v(D) m(D) N(D) \Delta D / \sum m(D) N(D) \Delta D$$

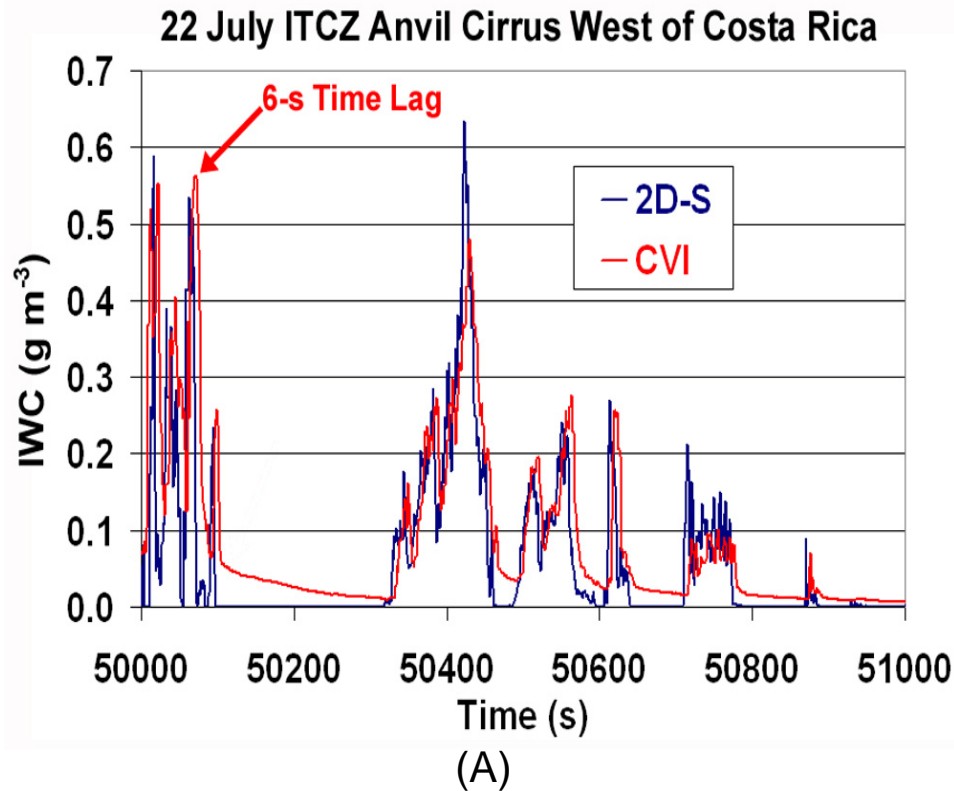

$$D_e = (3/2) \sum m(D) N(D) \Delta D / (\rho_i \sum A(D) N(D) \Delta D)$$

- $m(D)$ & $A(D)$ are bin mass or bin area concentration / bin number conc.

3. Relate V_m and D_e to T and IWC for model validation purposes

4. Relate V_m to D_e to predict V_m from the model microphysics scheme

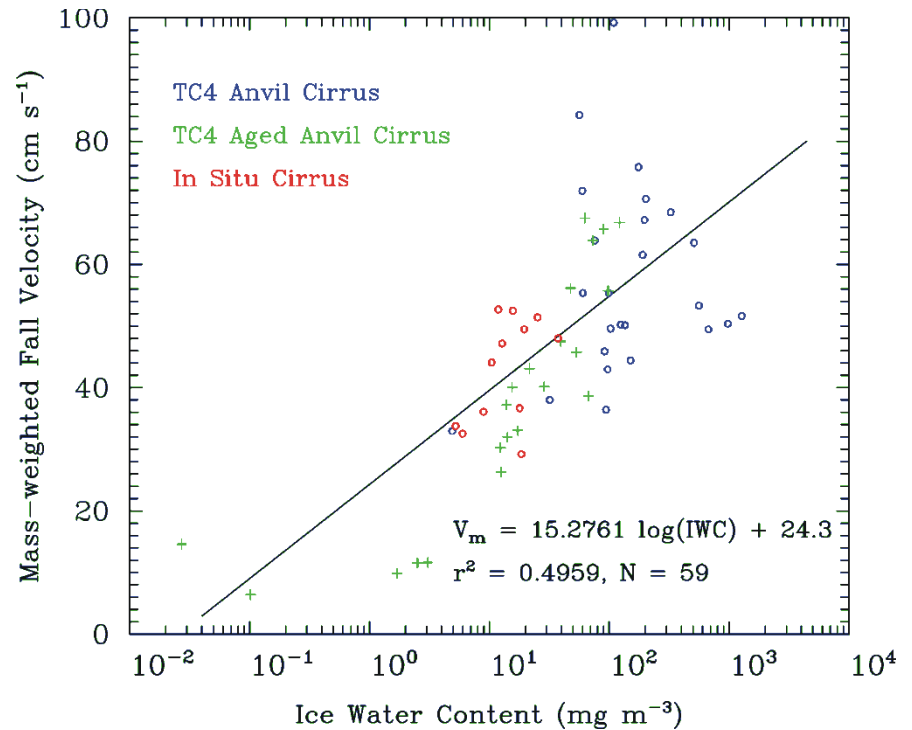

COMPARISON OF 2D-S AND CVI IWCs DURING TC4

A: Time series of the 2D-S and CVI IWC for a TC4 case study. CVI response time lagged 6 seconds behind 2D-S measurements, producing a slight offset.

B: 2D-S IWCs compared with CVI IWCs for 12,000 1-Hz measurements (averaged over 10-s) in TC4 anvils cirrus.

Mass-weighted fall velocity was related to both temperature and IWC during TC4. Therefore try multiple regression using both T and IWC...

BEST METHOD FOR DIAGNOSING V_m : USE T AND IWC

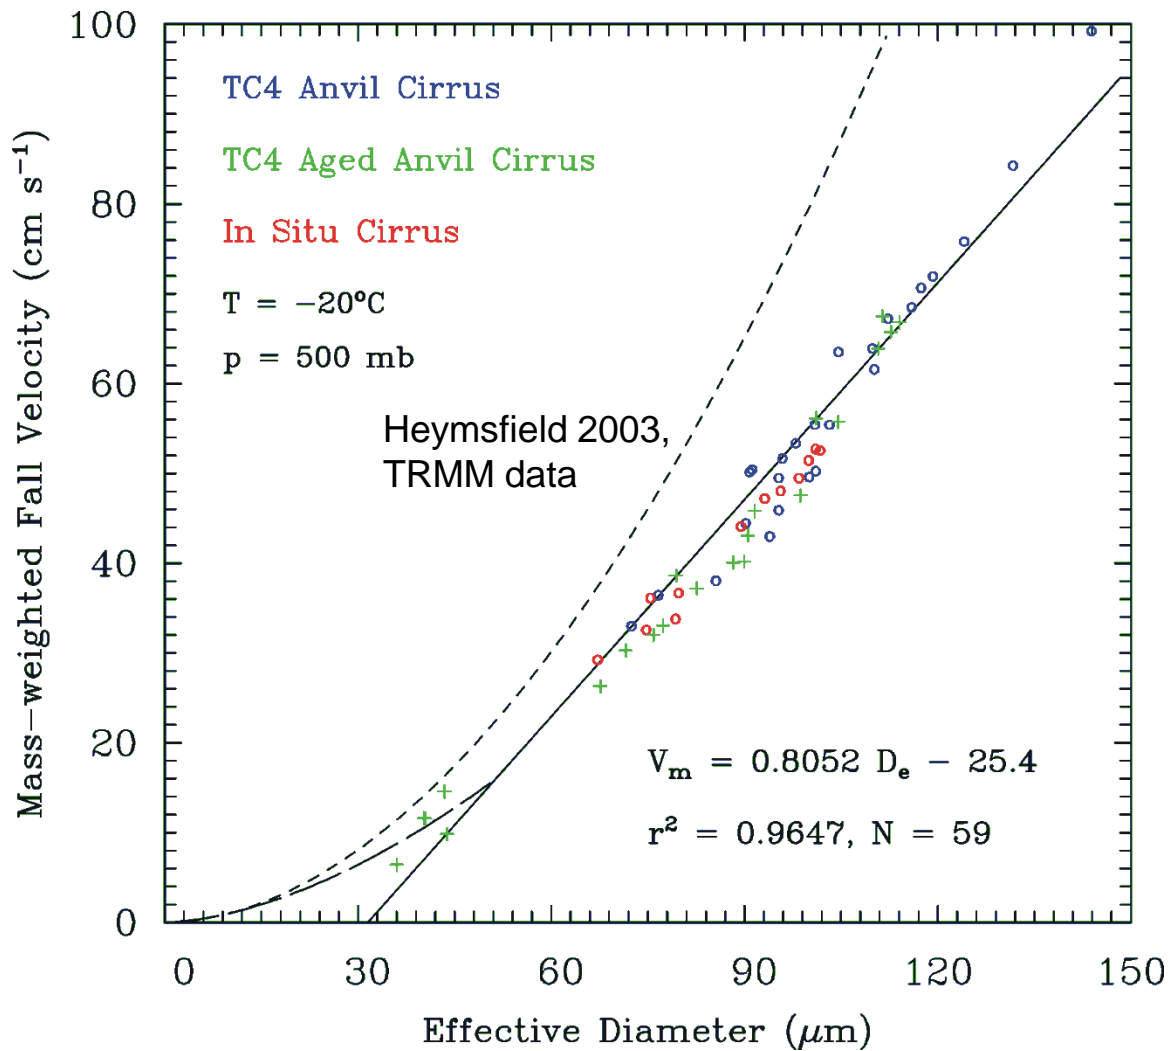

ISDAC FIELD CAMPAIGN

RECOMMENDED METHOD: CALCULATE V_m FROM MICROPHYSICS

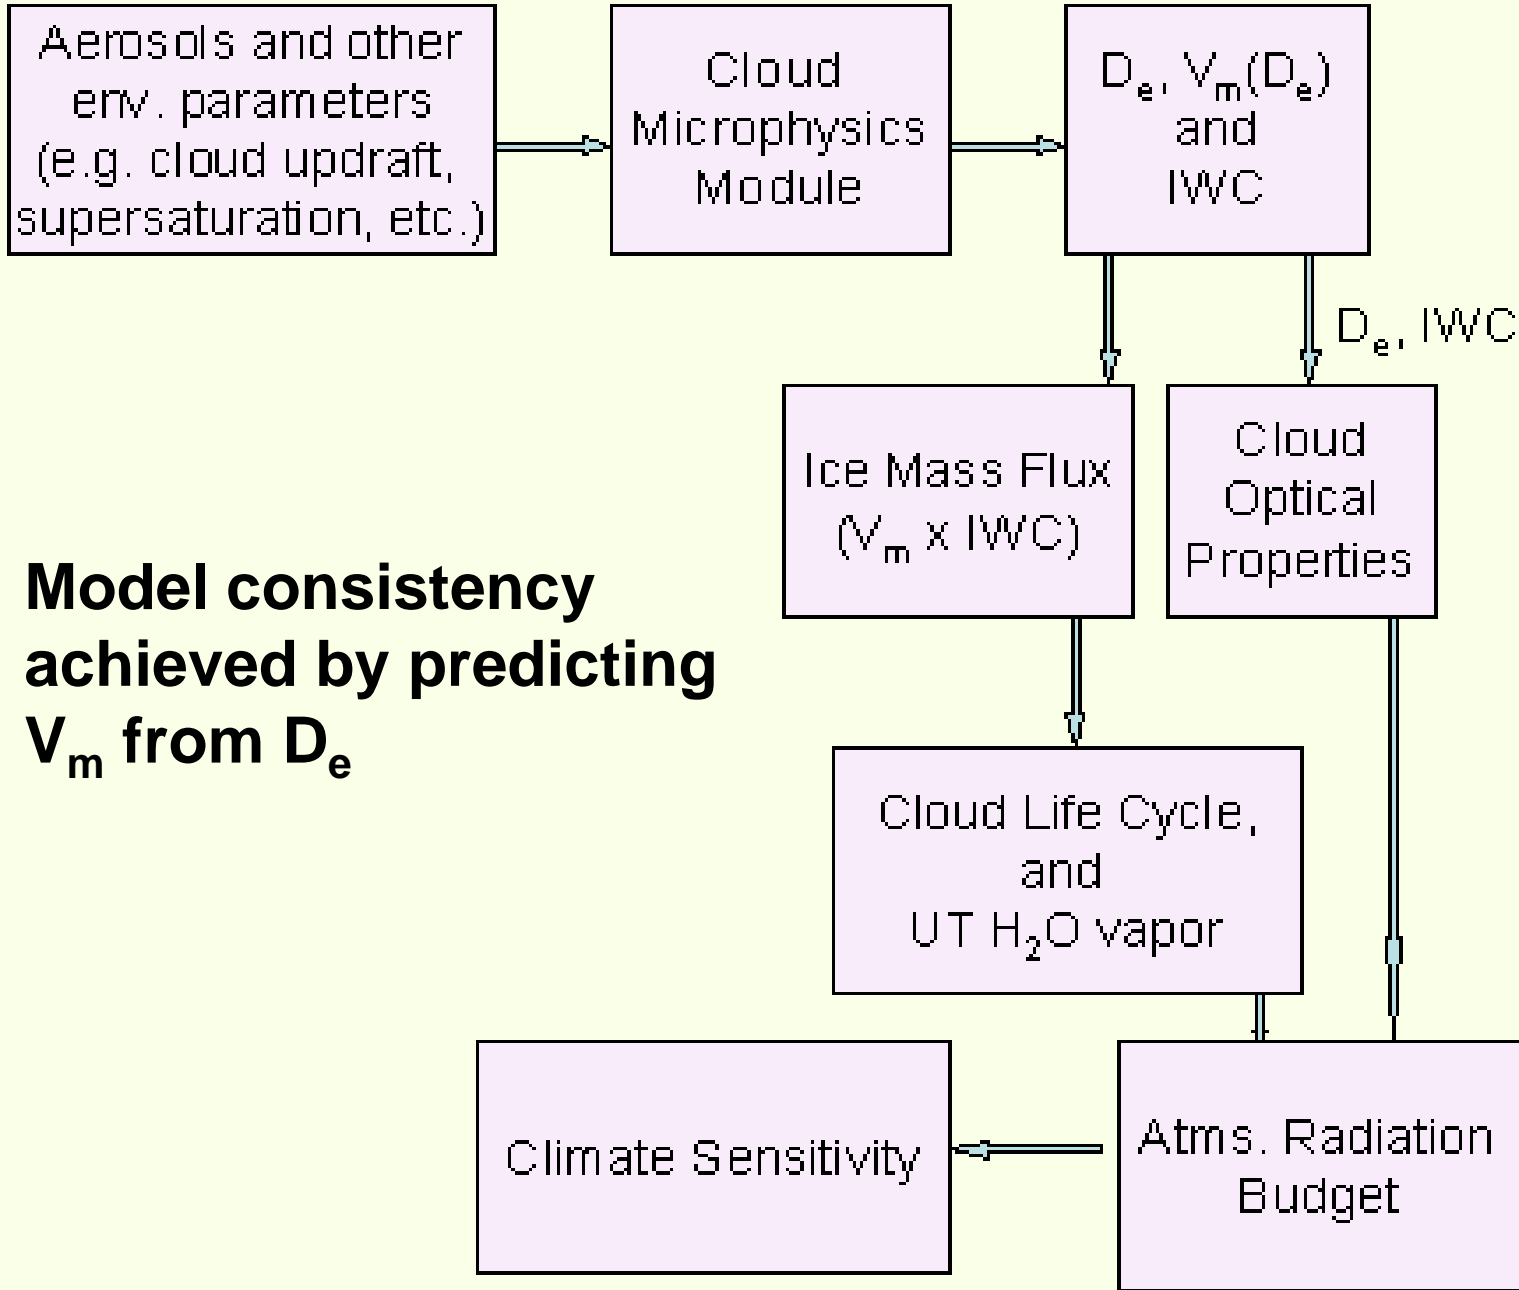

- High correlation since both D_e and V_m are based on ice particle mass/area ratio -

SIMILAR V_m CORRELATION FROM ISDAC FIELD CAMPAIGN

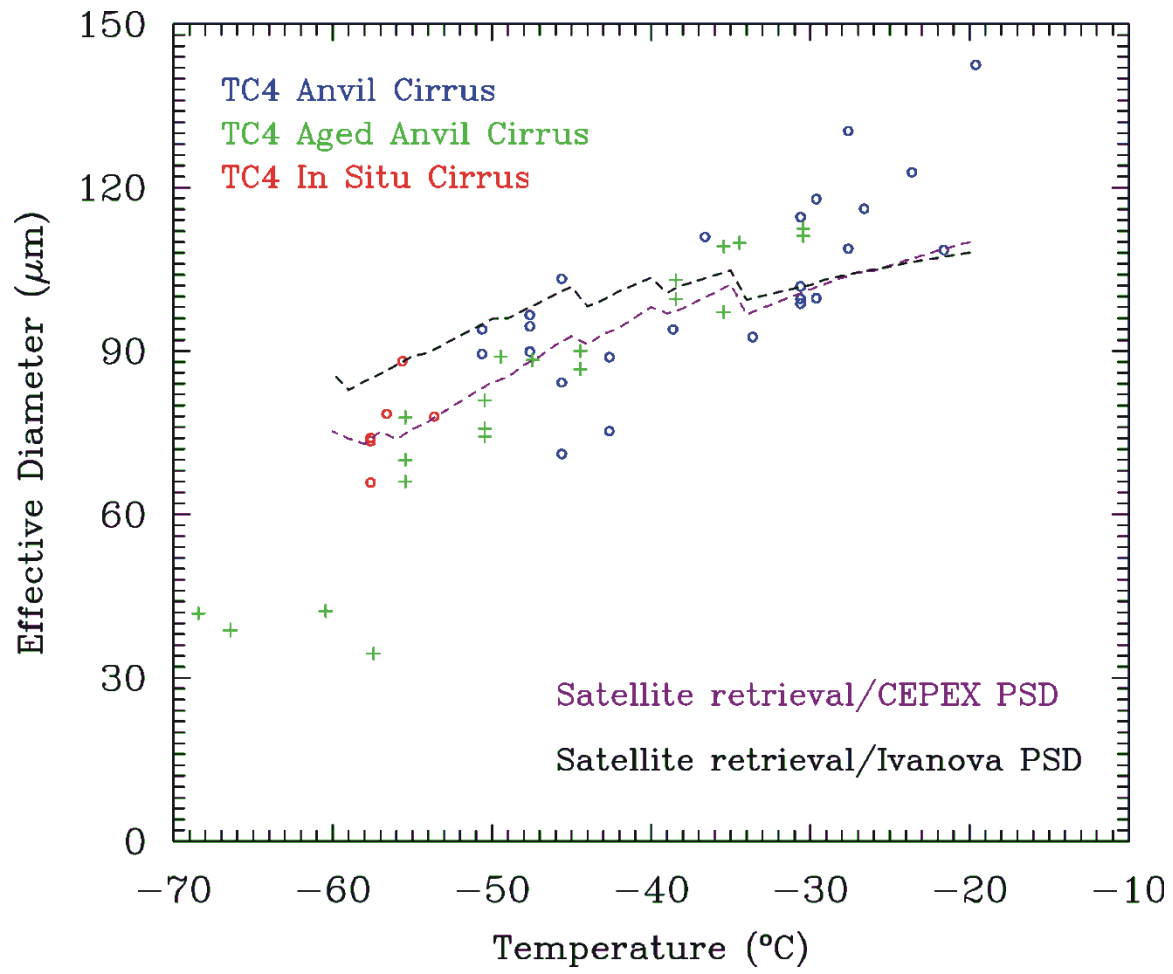

- High correlation since both D_e and V_m are based on ice particle mass/area ratio -

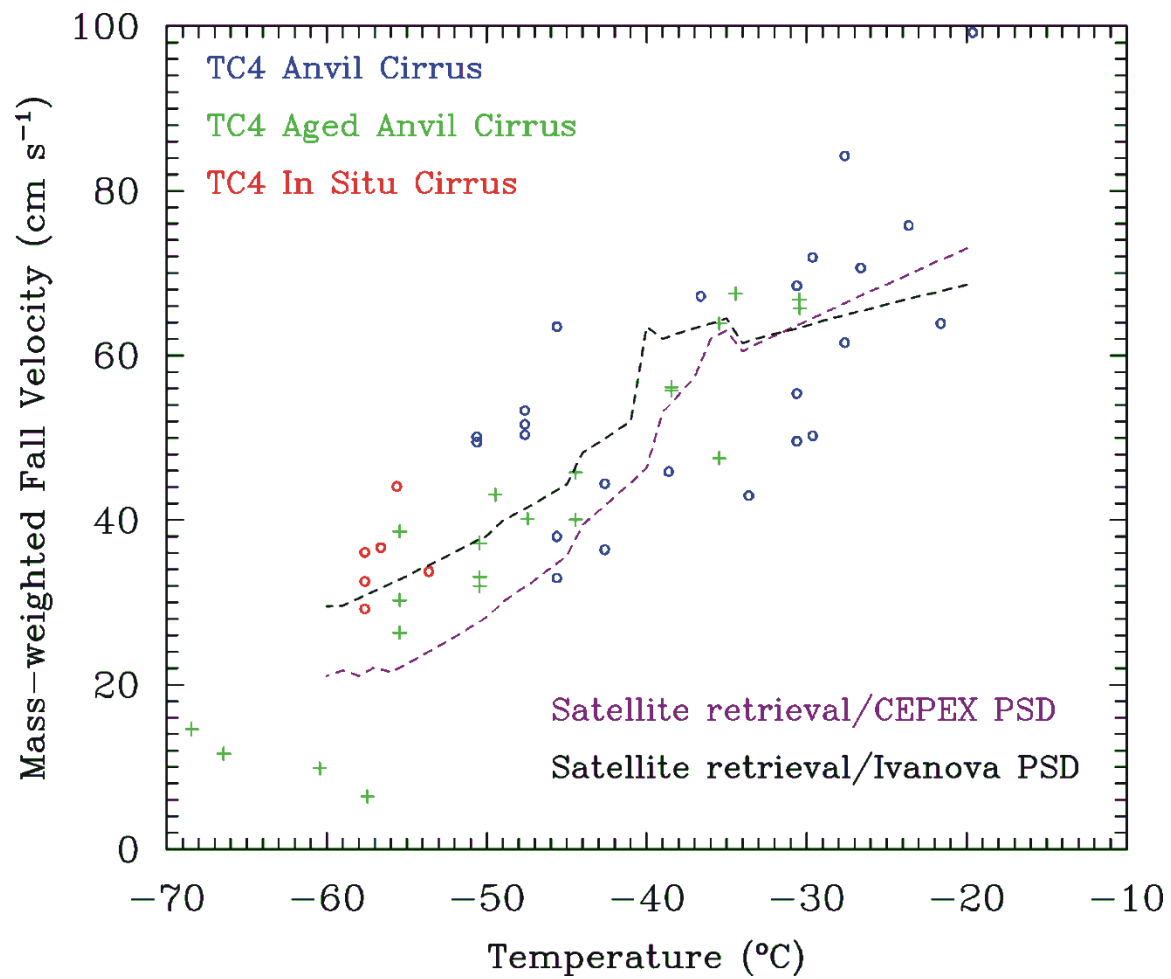

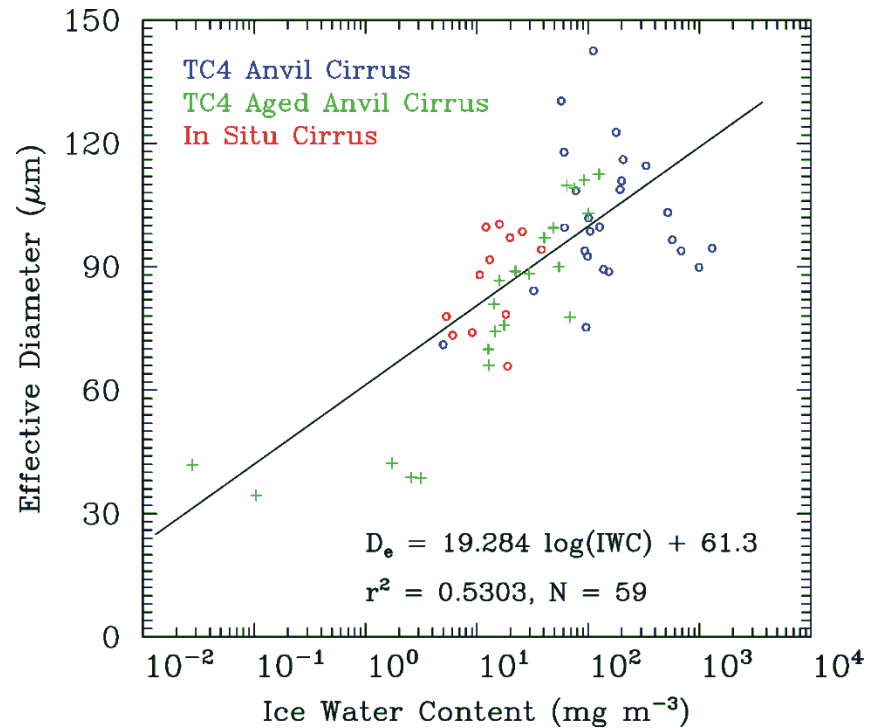

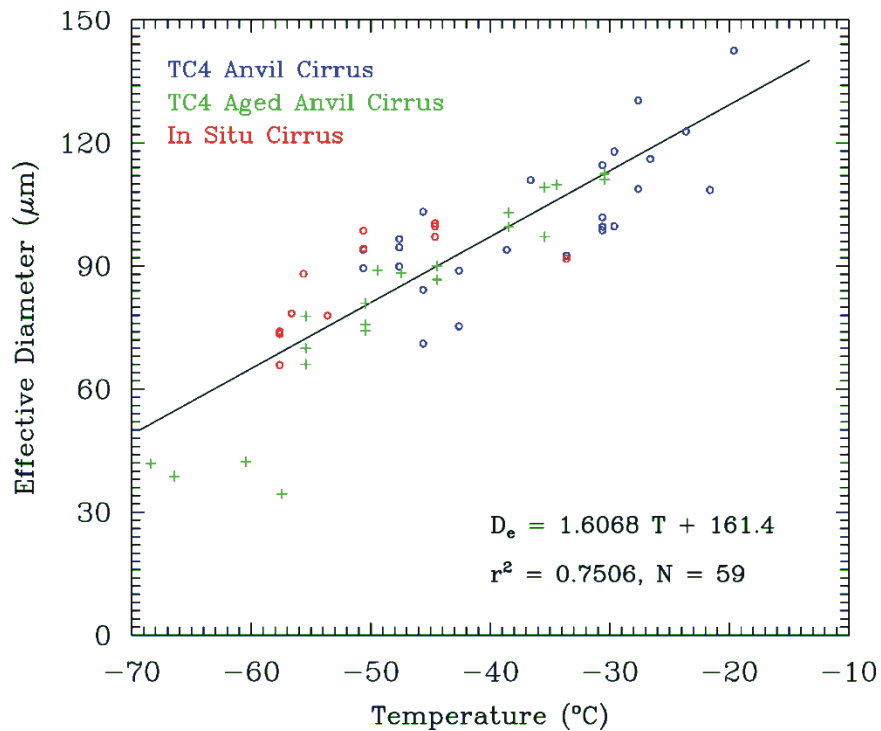

Model consistency achieved by predicting V_m from D_e

EXTRA SLIDES

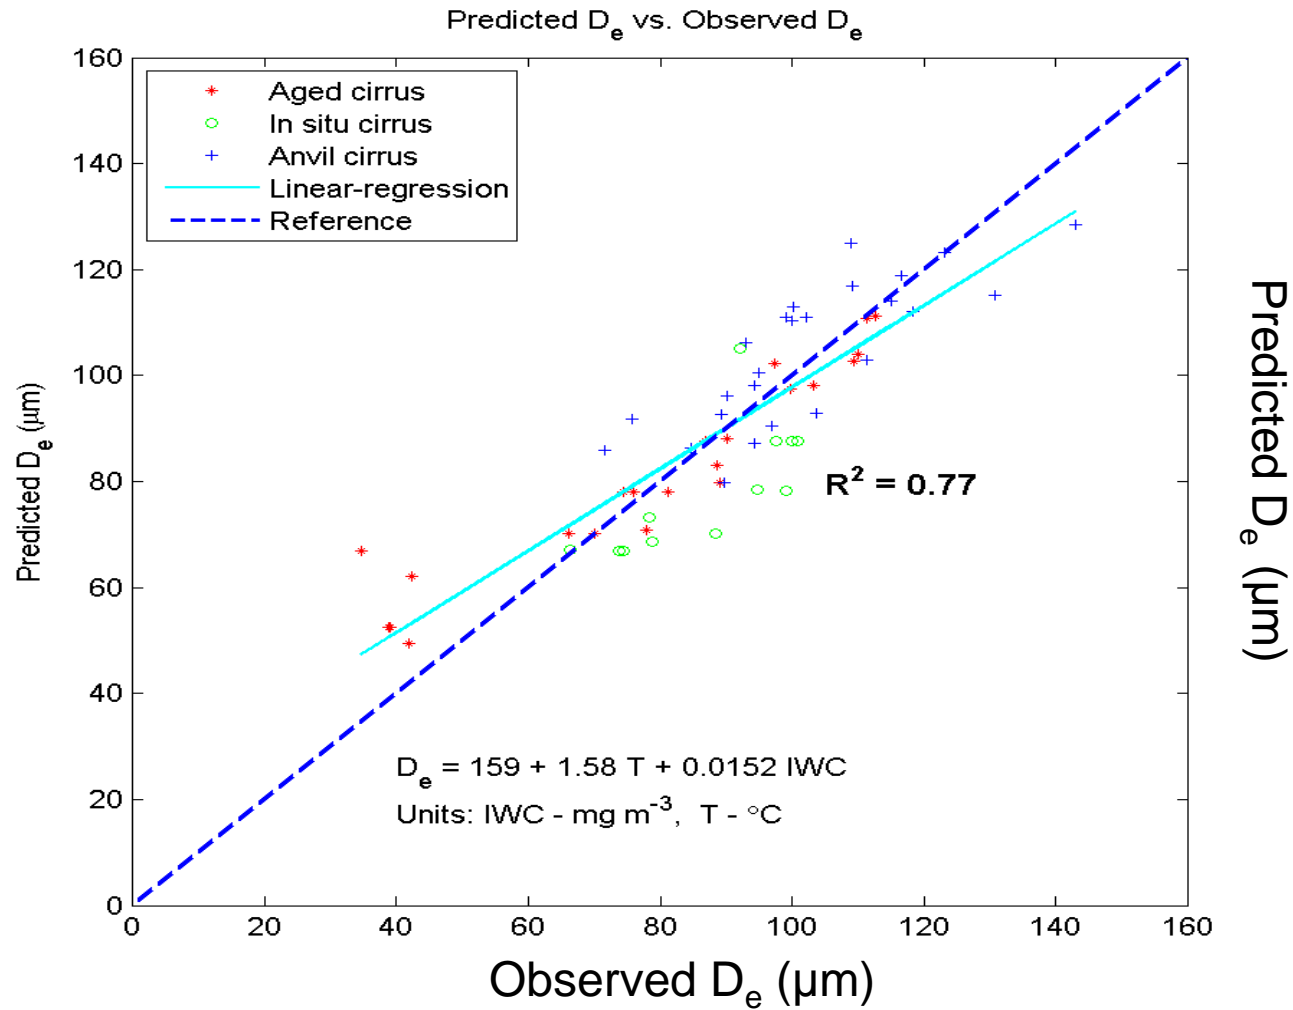

Effective diameter was related to both temperature and IWC during TC4. Therefore try multiple regression using both T and IWC...

Best method for diagnosing D_e : Use T and IWC

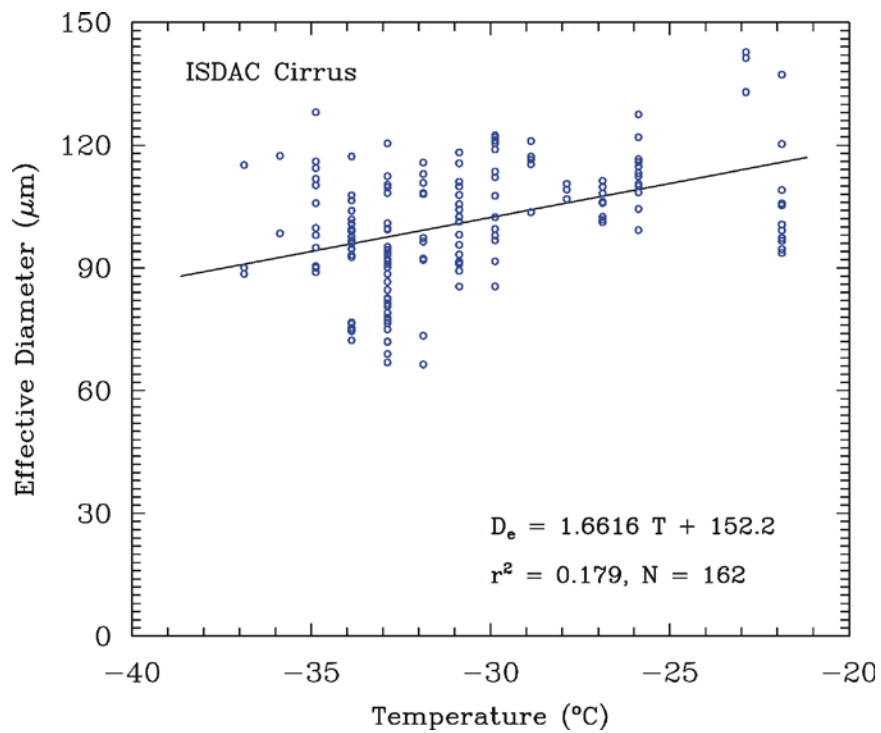

ISDAC FIELD CAMPAIGN

No correlation for D_e -IWC or V_m -IWC

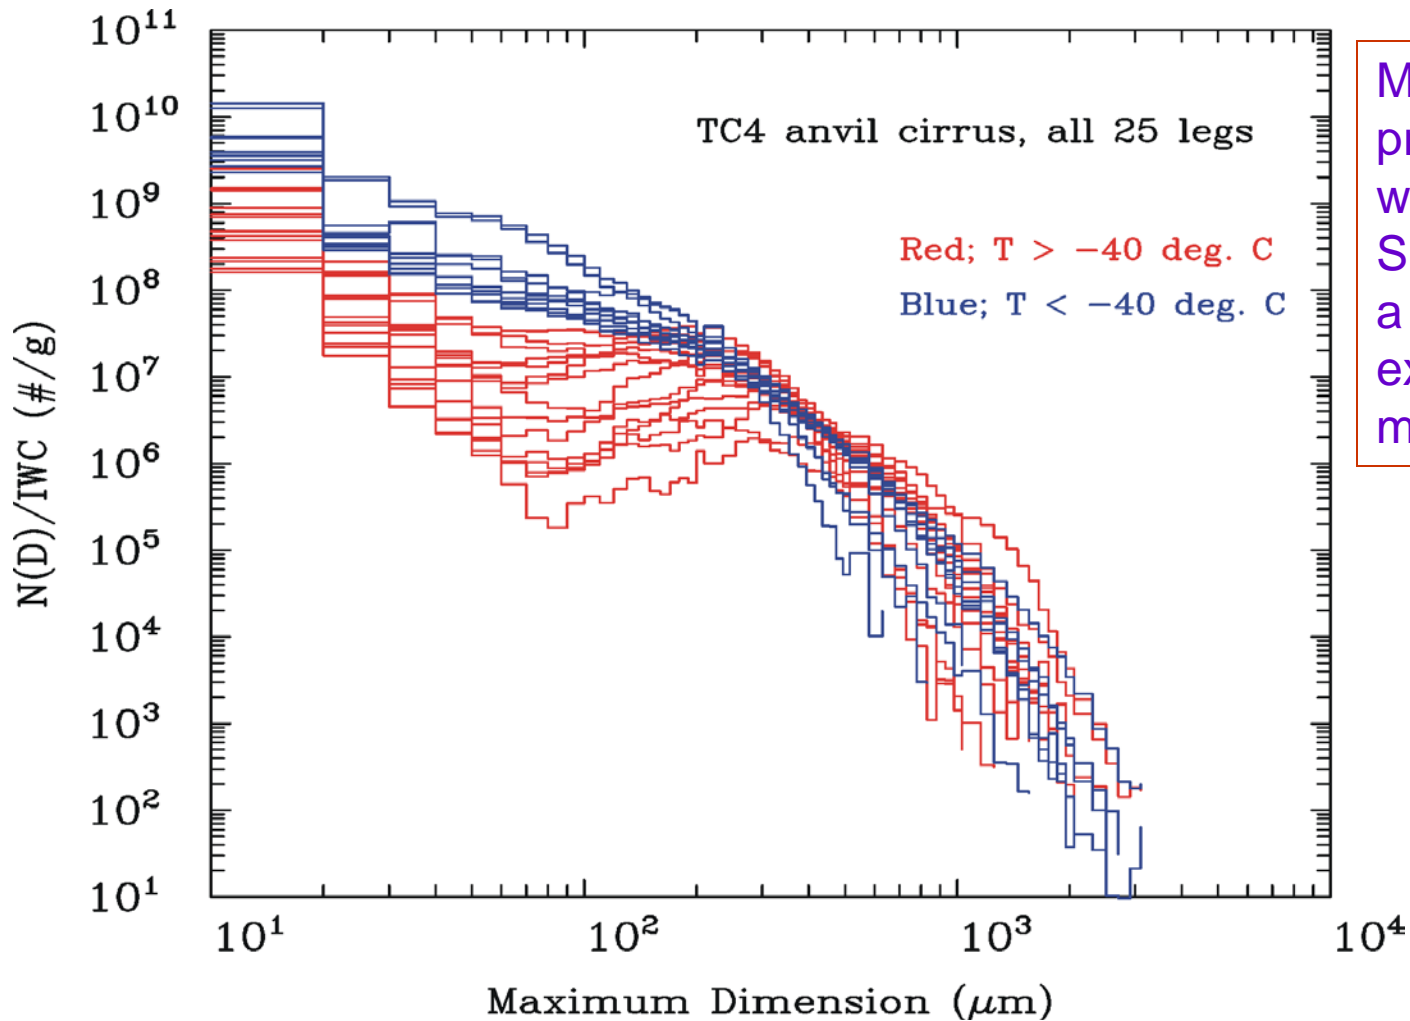

Crude diagnostics for D_e and V_m

TC4 PSD Differences for $T < -40$ °C vs. $T > -40$ °C

Leg-averaged PSD for anvil cirrus measured during TC4, normalized by their IWC. PSD for $T < -40$ C are monomodal due to higher concentrations of small crystals. For $T > -40$ C, these concentrations are lower and PSD are bimodal. Responsible mechanisms could be homogeneous freezing nucleation or “size sorting”.

Mitchell ASR project/SPartICus work plan: Analyze SPartICus data in a similar way to explore potential mechanisms.
