

# Summary: Prescribed Aerosol

Current Differences between Prescribed Aerosol and  
Predicted Aerosol Runs

# Prescribed Aerosol

- ▶ Model Tag: pmam03\_cam5\_0\_54 + fixed SST + no deposition fluxes to the surface (now being re-examined in CAM5.1.06)
- ▶ Two microphysical and radiation calls can be done independently.
  - One with predicted aerosols and the other one with prescribed aerosols.
- ▶ Our goal is to produce a very similar climate to the predicted aerosol simulation using prescribed aerosols.
  - Control: Predicted Aerosol are archived (aerosol number and mass)
  - Prescribed run: Read-in archived aerosols, use in radiative transfer calculation and cloud microphysics
  - We preprocess archived aerosol data using the “*time-diddling*” scheme by K. Taylor (just like SST). Thus, the monthly mean values of aerosol mass and number are consistent even after time-interpolation with monthly mean values.

# Prescribed Aerosol to Microphysics

- ▶ Let “X” be an aerosol property (mass, or number)
- ▶ Case 0:  $X = X_{ucs}$  Results are not shown here.
- ▶ Case 1:  $X = X_{cs} * f_{lcloud} + X_{ucs} * (1 - f_{lcloud})$
- ▶ Case 2:  $X = X_{cs} * f_{lcloud} + (X_{ucs} - X_{cs}) * (1 - f_{lcloud})$ 
  - X: Final values provided to microphysics
  - $X_{cs}$ : Conditionally sampled aerosol properties *when clouds present* (mass and number)
  - $X_{ucs}$ : Unconditionally archived aerosol properties
  - $f_{lcloud}$ : liquid cloud fraction
  - $X_{cs}$ :  $f_{lcloud} > 0.0$
- ▶ Case 3:  $X = X_{cs} * f_{lcloud} + (X_{ucs} - X_{cs}) * (1 - f_{lcloud})$ 
  - Conditionally sampled aerosols depend on liquid cloud fraction we used for sampling.
  - $X_{cs}$ :  $f_{lcloud} > 0.1$

# Prescribed Aerosol

## ▶ Case 0:

- Our first naive attempt produced too many liquid droplets and larger cloud liquid water path than runs with predicted aerosols.
- Droplet ~ 24% difference
- likely due to the time averaged aerosols producing too high drop activation in cloudy environments.

## ▶ Cases 1 -3 are on our web:

[http://climate.pnl.gov/sitemap/cam/cam\\_public/camruns\\_public.php](http://climate.pnl.gov/sitemap/cam/cam_public/camruns_public.php)

- C01: Case 1
- C02: Case 2
- C03: Case 3
- All the results are 5-year averages.

# Difference: Prescribed - Predicted

## FSTOM

<b>Case 1</b>	<b>-2.1W/m<sup>2</sup></b>
Case 2	0.7W/m <sup>2</sup>
Case 3	0.4W/m <sup>2</sup>

## SWCF

<b>Case 1</b>	<b>-2.3W/m<sup>2</sup></b>
Case 2	1.0W/m <sup>2</sup>
Case 3	0.5W/m <sup>2</sup>

## AODVIS

<b>Case 1</b>	<b>0.005</b>
Case 2	0.005
Case 3	0.005

## LWCF

<b>Case 1</b>	<b>0.3W/m<sup>2</sup></b>
Case 2	0.2W/m <sup>2</sup>
Case 3	0.1W/m <sup>2</sup>

**Residual fluxes at the top of the model are mainly caused by cloud not by AOD.**

# Difference: AODVIS (Annual)

Aerosol optical depth (550 nm) mean= 0.13 dimensionless

Aerosol optical depth (550 nm) mean= 0.13 dimensionless

Aerosol optical depth (550 nm) mean= 0.13 dimensionless

Aerosol optical depth (550 nm) mean= 0.12 dimensionless

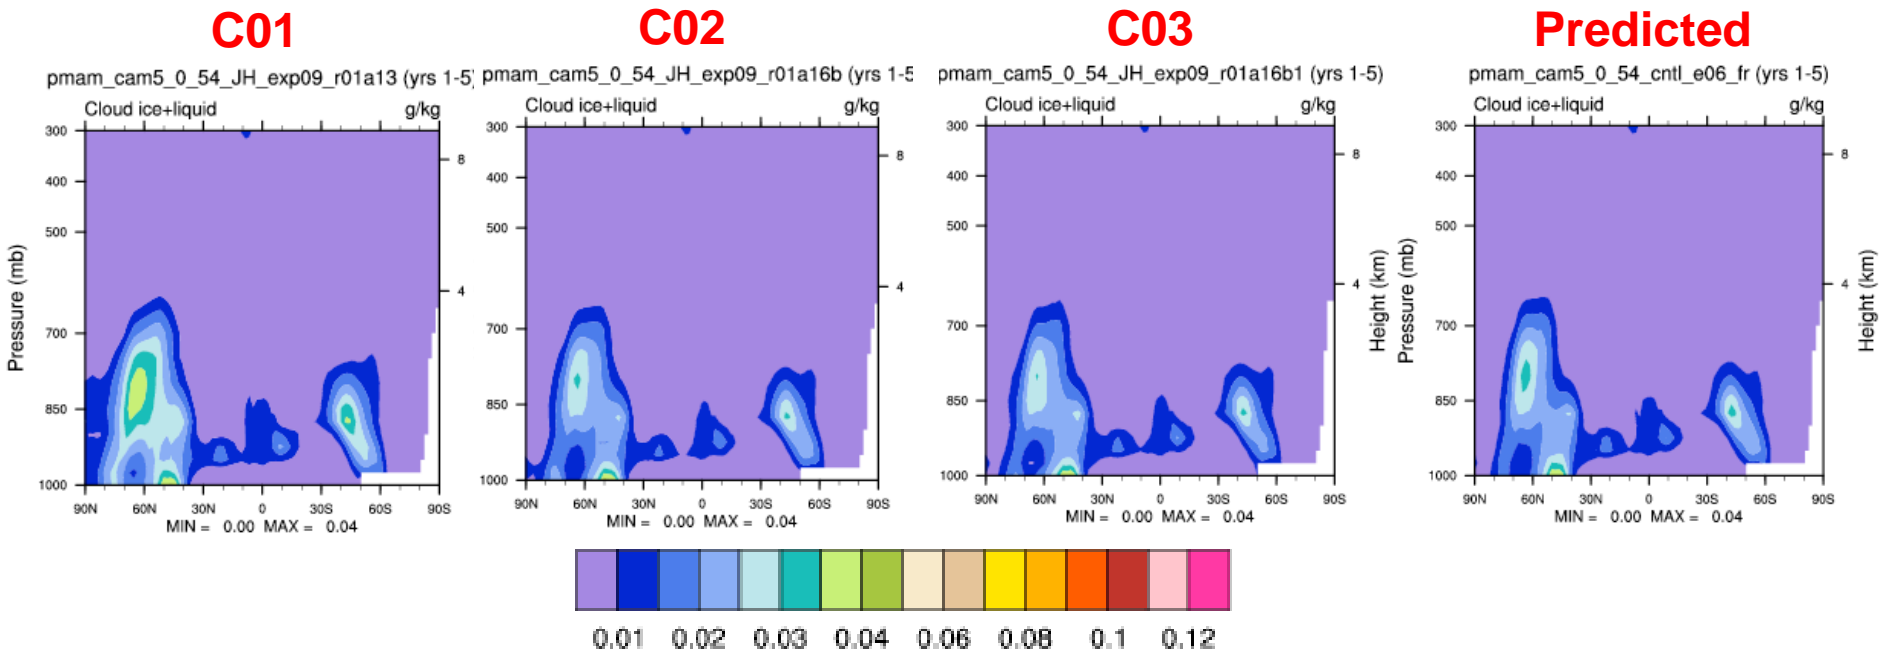

► AOD is very well simulated.

Pacific Northwest  
NATIONAL LABORATORY

Proudly Operated by Battelle Since 1965

# Difference: CWAT (JJA)

- ▶ Annual mean agrees better than northern summer case.
- ▶ Cloud water is quite well simulated in various settings
  - C02 & C03 are much improved.

# Difference: SWCF (JJA)

TOM SW cloud forcing mean= -53.38 W/m<sup>2</sup>

TOM SW cloud forcing mean= -50.39 W/m<sup>2</sup>

TOM SW cloud forcing mean= -49.78 W/m<sup>2</sup>

TOM SW cloud forcing mean= -50.44 W/m<sup>2</sup>

- ▶ Regional difference.
- ▶ C03 agrees better with predicted aerosols run.

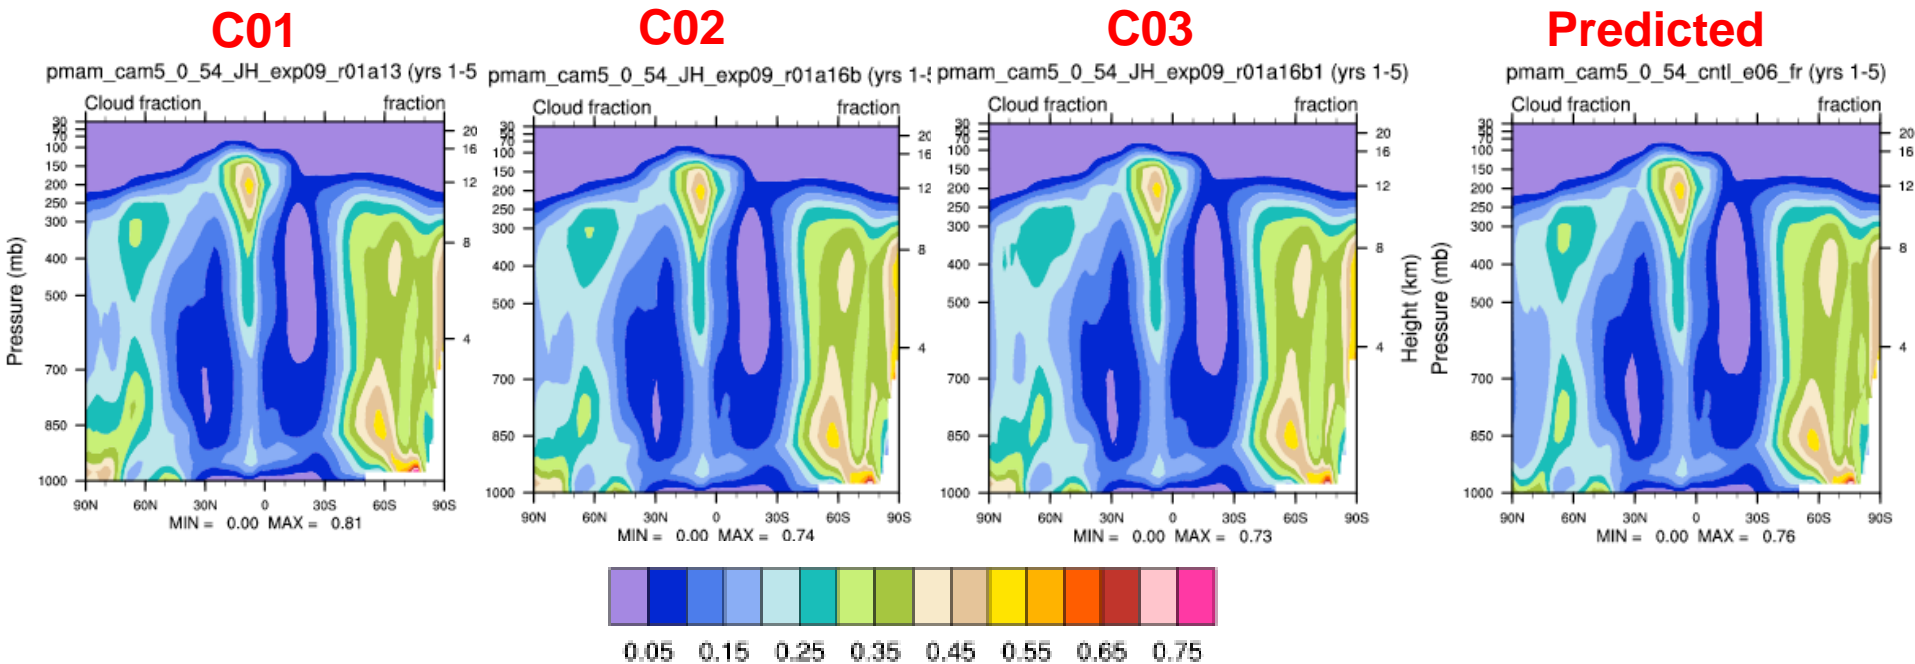

Pacific Northwest  
NATIONAL LABORATORY

Proudly Operated by Battelle Since 1965

# Difference: Cloud fraction (JJA)

- ▶ One of the largest difference is found in cloud fraction during **northern summer season** over **the Arctic**.

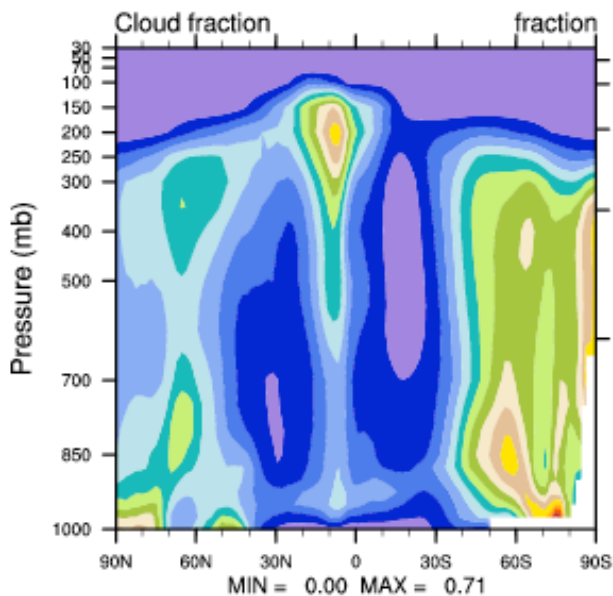

Pacific Northwest  
NATIONAL LABORATORY

Proudly Operated by Battelle Since 1965

# Deposition fluxes to the surface

JJA

pmam\_cam5\_0\_54\_JH\_exp09\_r01a17 (yrs 1-5)

pmam\_cam5\_0\_54\_JH\_exp09\_r01a16b (yrs 1-5)

► All the previous experiments were done without **deposition fluxes** to the surface

- Figure above tested now uses the deposition fluxes (shown above, compared to Case 1).
- Impacts are not critical in AMIP-style runs, but this can be critical in fully coupled runs (not tested yet).

Pacific Northwest  
NATIONAL LABORATORY

Proudly Operated by Battelle Since 1965

# 5-year climatology of prescribed aerosols

JJA

pmam\_cam5\_0\_54\_JH\_exp09\_r01a16c (yrs 1-5)

pmam\_cam5\_0\_54\_JH\_exp09\_r01a16b (yrs 1-5)

- ▶ In real case, 5- or 10-year mean aerosol mass and numbers are used.
  - Slightly more clouds are simulated (against Case 1).

Pacific Northwest  
NATIONAL LABORATORY

Proudly Operated by Battelle Since 1965

# Why did we produce such different Arctic summer clouds?

## ► **Unrealistically low aerosol numbers and mass** in the predicted aerosol runs

- Unrealistic values of aerosols  $< 0.1/\text{cm}^3$  or are simulated in the Arctic during northern summer
- The monthly prescribed aerosols, do not show these low aerosol numbers.
- As soon as we have more aerosols, more cloud will be created. We think it will reduce discrepancy between prescribed and predicted aerosols.

Daily variation at (10E,80N) Z=3

num\_a1, SLP (Z=3)

num\_a1, L CLOUD (lon=10E)

- Aerosol deposition, especially wet deposition is the key removal process.

# Three paths forward

(We never did this kind of careful evaluation of “interactive versus prescribed” aerosols with CAM3 or CAM4)

1. Continue to search for a better solution in present model
2. Test the current solution
  - But recognize the Arctic summer cloud and resulting difference in radiation properties are changed. This could influence our results especially in the fully coupled run.
  - We are running SOM to examine “climate sensitivity”.
  - If it is promising, we’ll try a fully coupled run.
3. Explore current solution with modified cloud/aerosols
  - Modifications to cloud processes (LLNL/PNNL)
  - Modifications to aerosols (PNNL)
