

The Latin American Modeling Project (LAMP)

Kate Calvin

**CESM SDWG Meeting
19 February 2013**

Boulder, Colorado

Long term research support provided by

Regional Model Comparisons

- ▶ We, at PNNL, were asked to coordinate a series of regional model comparison efforts for the U.S. Environmental Protection Agency.

- ▶ The studies:
 - The Asia Modeling Exercise (AME): 2009-2012
 - The Latin American Modeling Project (LAMP): 2012-?
 - An African Modeling Exercise: TBD

Pacific Northwest
NATIONAL LABORATORY

Proudly Operated by **Battelle** Since 1965

THE ASIA MODELING EXERCISE (AME)

Long term research support provided by

Goals of AME

- **Objective:** to better articulate the role of Asia in addressing climate change.
- **Goal:** To bring together global modelers that commonly participate in efforts to explore international policy architectures with regional modelers and experts with Asia-specific knowledge, understanding, data, and analysis.
- **Method:** A coordinated modeling exercise that attempts to link these communities to provide more effective modeling and analysis of Asia within a global context.

Final Product: the Journal

- Results from the project were published in a special issue of Energy Economics in December 2012
 - 7 overview articles
 - 20 individual modeling team articles

Pacific Northwest
NATIONAL LABORATORY

Proudly Operated by **Battelle** Since 1965

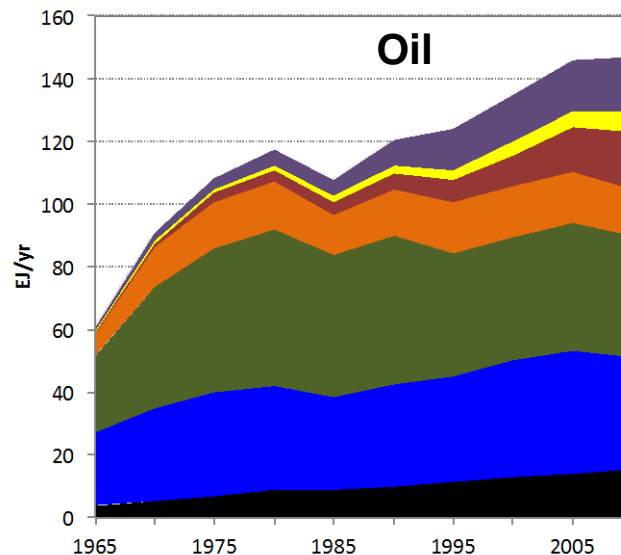

THE LATIN AMERICA MODELING PROJECT (LAMP)

Long term research support provided by

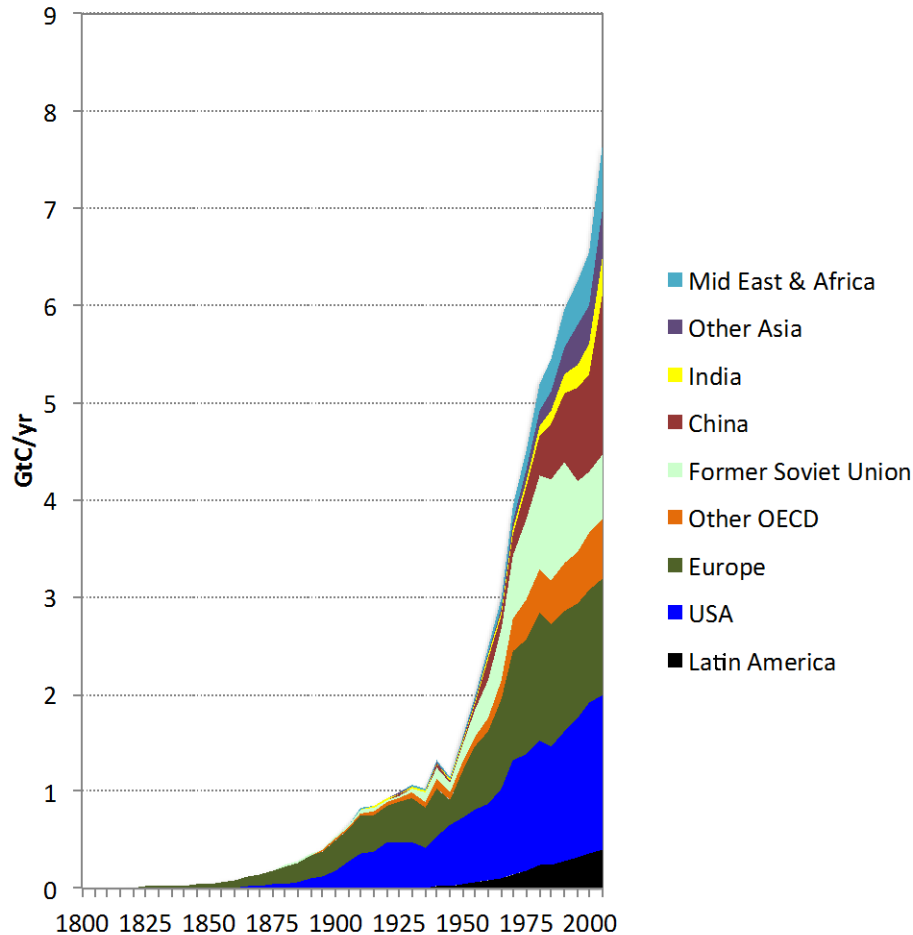

In 2010, Latin America Consumed ~10 EJ of Fossil Fuels (Mostly Oil).

Source: BP (2011). "BP Statistical Review of World Energy June 2011"

In 2005, Latin America Emitted ~0.4 GtC from Energy-Related Activities and ~0.6 GtC from Land Use Change

Fossil Fuel & Industrial CO₂

Land-Use Change CO₂

- ▶ Global Modeling Teams included:
 - EPPA (MIT, USA)
 - GCAM (PNNL, USA)
 - iPETS (NCAR, USA)
 - Phoenix (Penn State, USA)
 - POLES (IPTS, EU)
 - TIAM-ECN (ECN, Netherlands)
 - TIAM-World (Kanlo-KanORS, France)

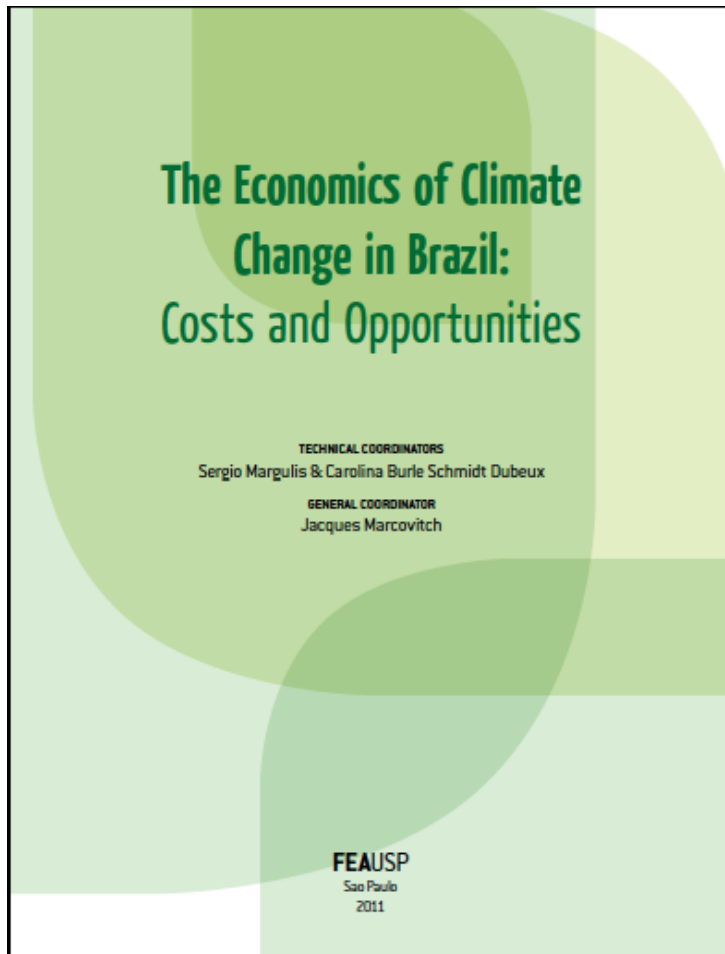

- ▶ Regional Modeling Teams:
 - MEG4C (DNP, Colombia)
 - MESSAGE-Brazil (COPPE, Brazil)
 - TBD (INE, Mexico)
 - CGE Model (RTI, Uruguay)
 - LEAP (FB, Argentina)
 - Land-use model (IPEA, Brazil)

- ▶ Participating modeling teams are varied
 - Some are energy system only.
 - Some are agriculture/land-use only.
 - Some have both.
- ▶ Some models will just do mitigation.
- ▶ Some will do impacts/adaptation.

- ▶ LAMP will have to design a set of scenarios that can link across the two fields (e.g., use the RCPs).

- ▶ The modeling teams doing impacts assessments are also varied.
 - Some are global and fairly aggregate. These models can use CMIP5 archive data, for scenarios that exist in the archive.
 - Others are regional and require higher resolution data. These models need climate data at a resolution of 50km.

Previous Impacts Studies in Latin America

- ▶ Inspired by the Stern Report
- ▶ Published in 2011
- ▶ Links physical impact models with economic models to calculate the cost of climate change for Brazil
- ▶ Looks at water, energy, agriculture, land use, and biodiversity
- ▶ Uses A2 and B2 scenarios
- ▶ Physical impact models required data at a 50km resolution. Used regional climate model, PRECIS, forced with data from the Hadley Center Model

Previous Impacts Studies in Latin America

Hadley Center Precipitation

Precipitation A1B: 2080-2099 DJF

Precipitation A1B: 2080-2099 JJA

Impacts Assessment Results

- ▶ Water supply reduced by 2/3
- ▶ Average decline in hydropower production in 2100 of 30% in the A2 (higher in some regions)
- ▶ Estimated cost of adapting to reduced hydropower on the order of \$50 billion

Climate Data Needs for Latin American Impacts Assessment

- ▶ Regional modeling teams would like to assess different scenario/climate model combinations, but need climate data at a 50km resolution.
- ▶ They currently rely on INPE to provide the necessary data. INPE has plans to provide more downscaled data, but are resource limited.
 - CLARIS project – data for A1B from HadCM3, ECHAM5
 - CORDEX – uses RCPs, will have LAM data, but current focus is Africa
 - They have plans to downscale: MIROC 4.5, IPSL 4.5, HadGEM-ES 4.5, CSIRO 4.5, CanESM 4.5, HadGEM-ES 8.5. Work just beginning (if it is still on schedule)

GCM Precipitation Comparison

Hadley Center Precipitation

Precipitation A1B: 2080-2099 DJF

Precipitation A1B: 2080-2099 JJA

CCSM3 Precipitation

Precipitation A1B: 2080-2099 DJF

Precipitation A1B: 2080-2099 JJA

Climate Data Needs for Latin American Impacts Assessment

- ▶ All teams could benefit from additional scenarios.
- ▶ Examples:
 - **3.7 W/m² Stabilization.** This is one of the more frequently assessed scenarios from a mitigation perspective, but we don't have climate data for it.
 - **Additional land cover scenarios.** Agriculture, forestry, land use are incredibly important in Latin America. Different policies will have different effects. Assessing the climate implications of these choices could be useful.
 - **SSPs.** New socioeconomic scenarios *may* have different regional emissions and land cover patterns than the official RCPs. This could be interesting for Latin America.
