

LUC4C

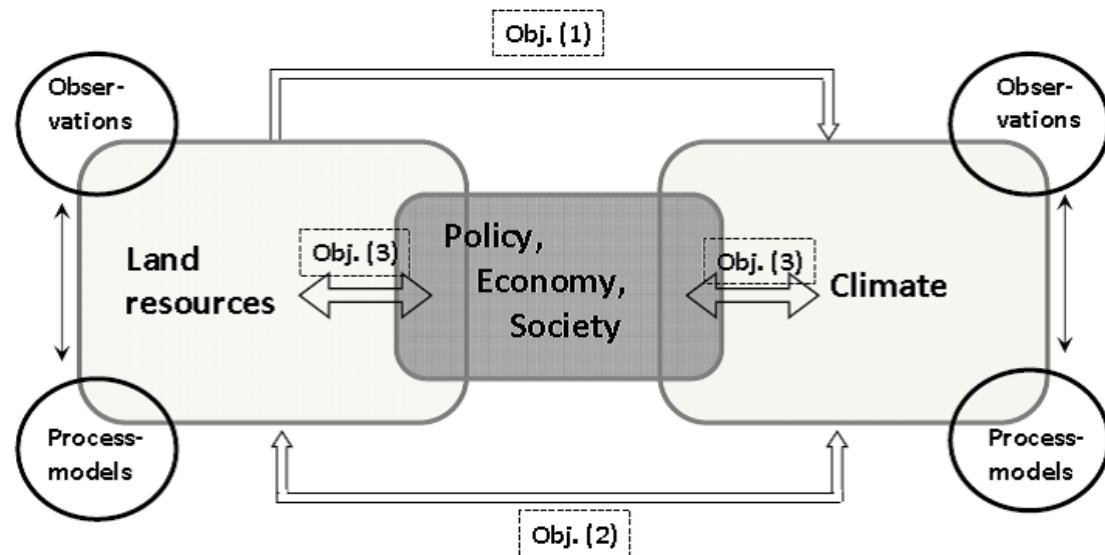

Land-use change:
assessing the net climate forcing, and
options for climate change mitigation
and adaptation

Project

- EU FP7 Integrated project: 603542 – *LUC4C*
- Duration 4 years, 01/11/2013 – 31/10/2017
- 15 Partners from 11 EU and 4 non-EU countries; total ca. 8 Mio € (6 Mio € from EU)

Challenges

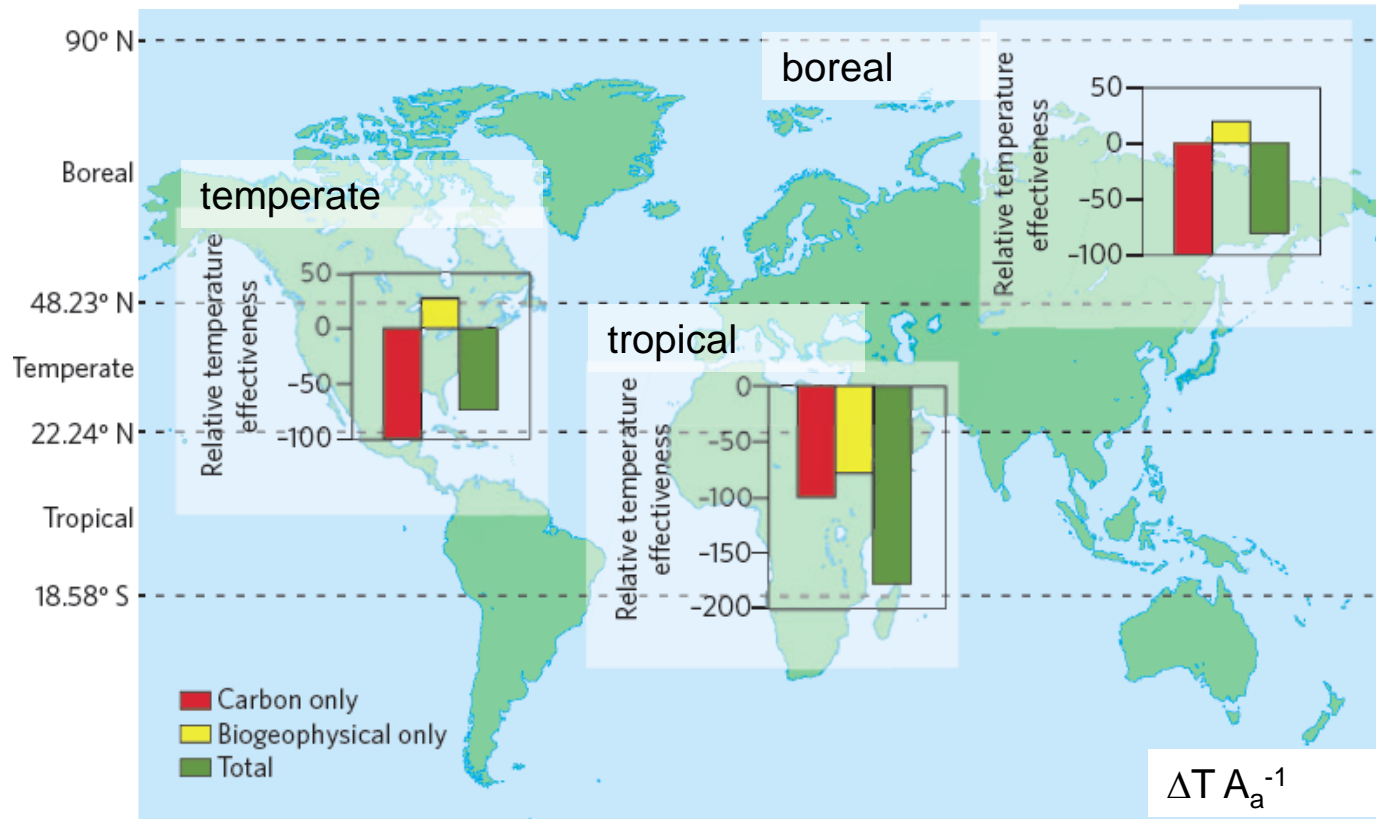

1. Key aspects of land use with the largest effect on climate, including their dependencies across time and space
2. Innovative methods to better quantify the dynamic interactions between land use and the climate system
3. Synthesis products and best practice guidelines for identification of benefits or adverse effects of land-based mitigation options & adaptation strategies

Some of the issues to be addressed

Climate effects of land cover/use: biophysical vs. biogeochemical

Experiment: Afforesting 50% of the regional crop area until 2060

Biophysical and biogeochemical climate effects of afforestation (and hence also deforestation) have regionally different magnitude and signs.

Uncertainties are large...e.g., attribution of the inter-model differences in Q_{LE} to:

VEG : Vegetation distribution. PAR : Land-Surface Parameters & parameterizations
REF : combines VEG & PAR. ALL & MOD = REF + remaining influences

Different decisions on land-transitions

(a)

(b)

(c)

(d)

Different estimates on LUC-CO₂ emissions

Global C budget (2000-09: PgC a-1)

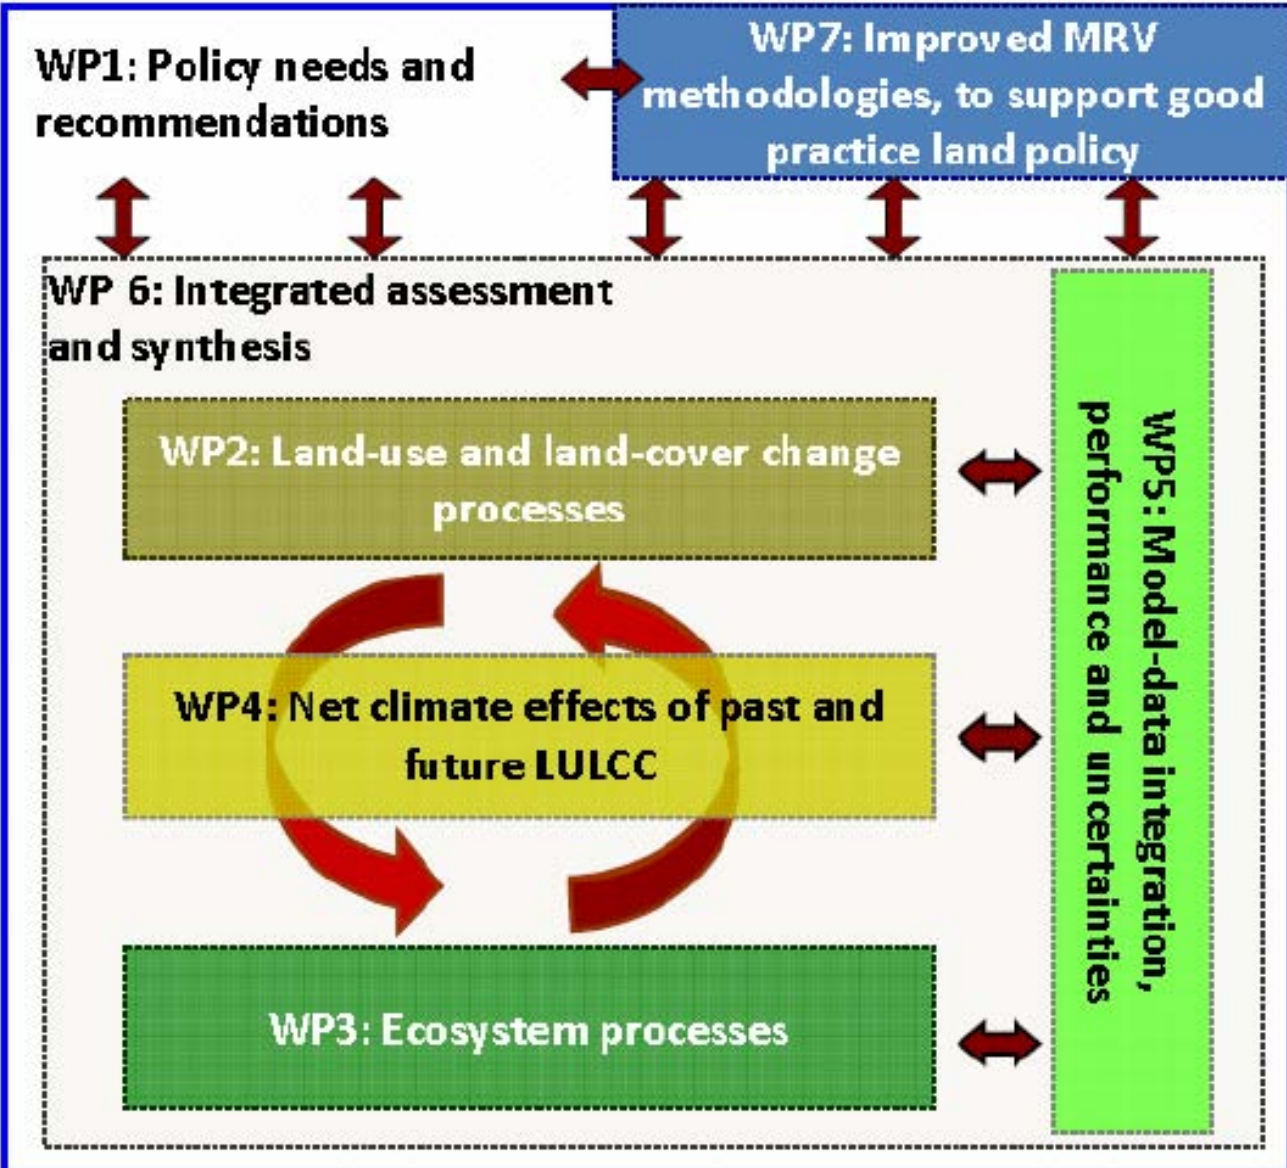

Emissions	
Fossil fuel combustion and cement production	7.8±0.4
Land-use change	1.0±0.5
Accumulations	
Atmospheric growth rate	4.0±0.1
Ocean sink	2.3±0.5
Residual terrestrial sink	2.5±0.8

Houghton et al., 2013; Le quéré et al., 2009

From land cover to land use: Influence of crop representation on LUC-CO2 emissions

- AR5 ESMs represented croplands as grasslands....
- Does it make a difference when attempting to account for crop-specific processes?

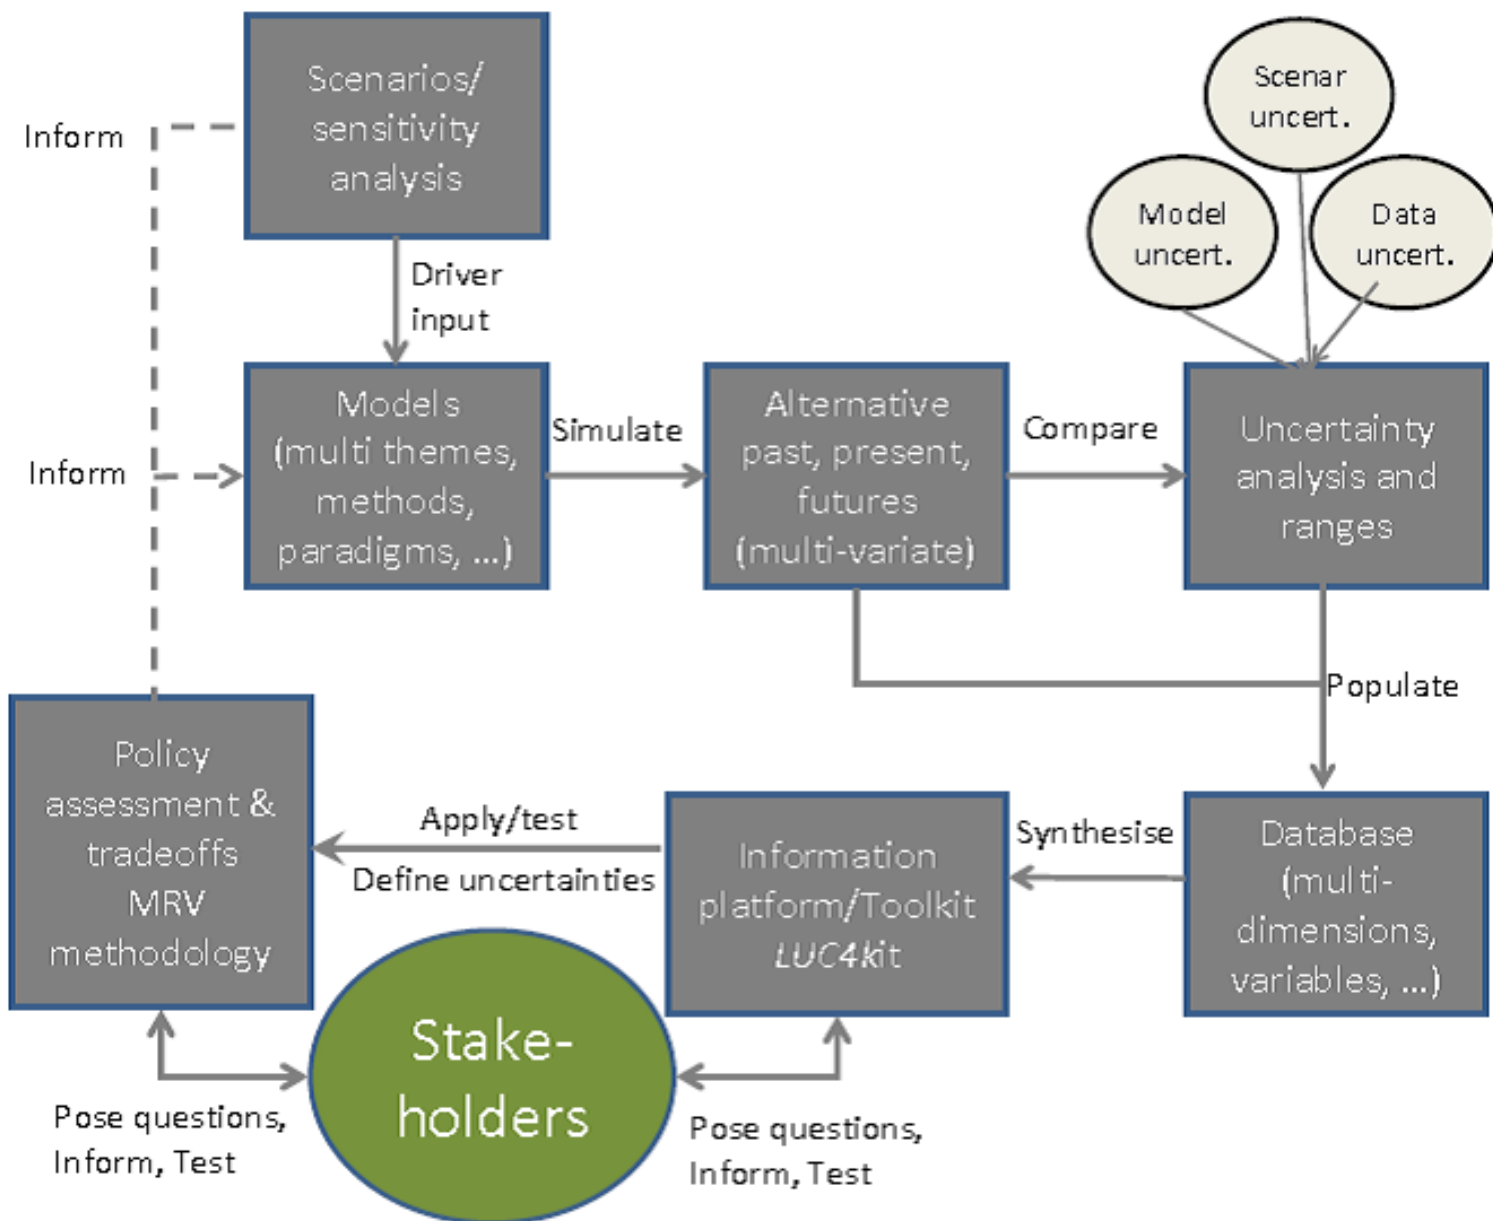

Focal regions

1. Globe
2. Continental Europe (EU and European Russia)
3. Sub-Saharan Africa
4. South/southeast Asia

LUC4C Performance of DGVMs in assessing LUC-mediated climate impacts; assess ESM capacity in detecting observed changes in *bph* and *bgc* land properties

Scenarios for land-based climate change mitigation, based on SSPs

LUC-model intercomparison

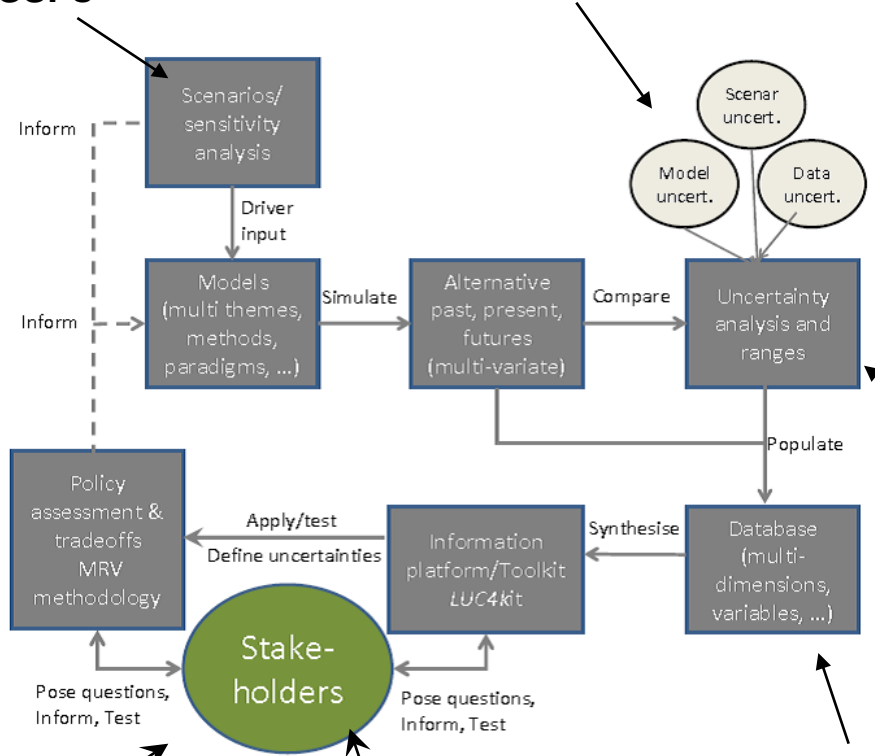

Identify indirect effects and trade-offs of land-use-based mitigation options

Good practice guidance on MRV

Synthesis of the potential effects of current and anticipated future land-use and -mitigation policy on the climate system

An analytic and model-based exploration of land system change as a mitigation option, also including adaptation

Methodology to incorporate land-use changes provided by IAMs and/or land-use models into ESMs

Impact of changing methodology to incorporate LUC on the modelled carbon cycle and climate
