

Land Ice Verification and Validation Kit

PISCEES Project V&V Team: Adrianna Boghozian, Kate Evans, Matt
Norman, Pat Worley (ORNL)
Steve Price and Matt Hoffman, LANL

LIVV Kit 'Raison d'etre'

- ⊗ Provide verification test suite for CISM testing as standalone and within CESM
- ⊗ Nightly autotesting of the code for bit-4-bit reproducibility
- ⊗ Python and NCL based code sits within CISM repo
- ⊗ Based on glide dycore, and working to extend it to others with access to output format to parse/process
- ⊗ Comes with build, submit, and LIVV set-up script designed for OLCF, NERSC, MAC OSX rel06 platforms
- ⊗ Performance V&V underway.
- ⊗ Need to talk as a community about validation, Thanks to Steve and Jer for starting this conversation.

Basic Workflow on LCF Systems

- ⊗ Access to code on hopper/titan/mac/blizzard
 - ⊗ Copy over reg_test and perf_test from the project space location on lustre at OLCF for benchmark files
 - ⊗ Copy over the /higher_order directory from the CISM repo to the execution area (LCF only)
 - ⊗ Run the master build script for that platform, pointing to reg_test location. If successful, it will launch the submit scripts to the machine and run all the tests
- ⊗ Access to LIVV carver/rhea/mac/blizzard in /higher-order
 - ⊗ Select options of interest (evaluate performance or just output?)
 - ⊗ Execute the script, view the website

Developers

• LIVV: Land Ice Validation & Verification

Latest Regression is bit for bit

A growing community of climate and computational scientists will be developing new versions of multiple CISM dycores. To support this development and maintain confidence in the mode, The LIVV kit within the PISCES (Predicting Ice Sheet and Climate Evolution at Extreme Scales) DOE SciDAC project provides robust, standardized model verification and validation. Verification aims to detect errors in the numerical and computational representation of a given mathematical model due to discretization or implementation errors (bugs). Validation then aims to quantify how well the model represents the physical processes being simulated.

Tests based on analytical and benchmark solutions are combined into a single executable LIVV script environment targeting the CISM2 model. As new dycores are implemented, we will need to verify developments that are not covered by standard test cases, such as spatial discretization, time stepping, and boundary conditions. We will extend the LIVV kit to run configured models over the desired parameter space and provide quantitative and graphical output.

PISCES is jointly funded by the Office of Biological and Environmental Research (BER) and the Office of Advanced Scientific Computing Research (ASCR) of the DOE Office of Science.

- ❁ BFB check for each test
- ❁ Times of last simulation to check if new
- ❁ Velocity Solver Details
 - ❁ Nonlinear and Linear iteration count
 - ❁ Presented in plot or list form depending on whether it's a time dependent case
- ❁ Case Details
 - ❁ All runtime settings are listed as a reference and for reproducibility
- ❁ Output plots of the benchmark, new run, and difference are presented for comparison

Test case configuration

- ❉ Runtime settings for the code are presented for each case and highlighted in red if different from the benchmark values
- ❉ Settings within the code are not incorporated (should be moved to runtime if changed frequently)

```
Case Details:

Configure File Settings

Output available from test run: acab arm beta topg thk usurf uvel vvel wvel flwa velnorm temp bheatflx bmlt bwat kinbemask
Grid Size (vert by ew by ns): 11x150x280
Grid Spacing (ew by ns): 10000x10000
Start/End Time: 0.,10.0, Number of time steps = 10.0

Parameters
-----
flow_factor = 1

Options
-----
flow_law = 2 different than benchmark value: 0
evolution = 3
temperature = 1 different than benchmark value: 3

HO Options
-----
which_ho_babc = 4
which_ho_efvs = 2 different than benchmark value: 0

Velocity Solver Settings:

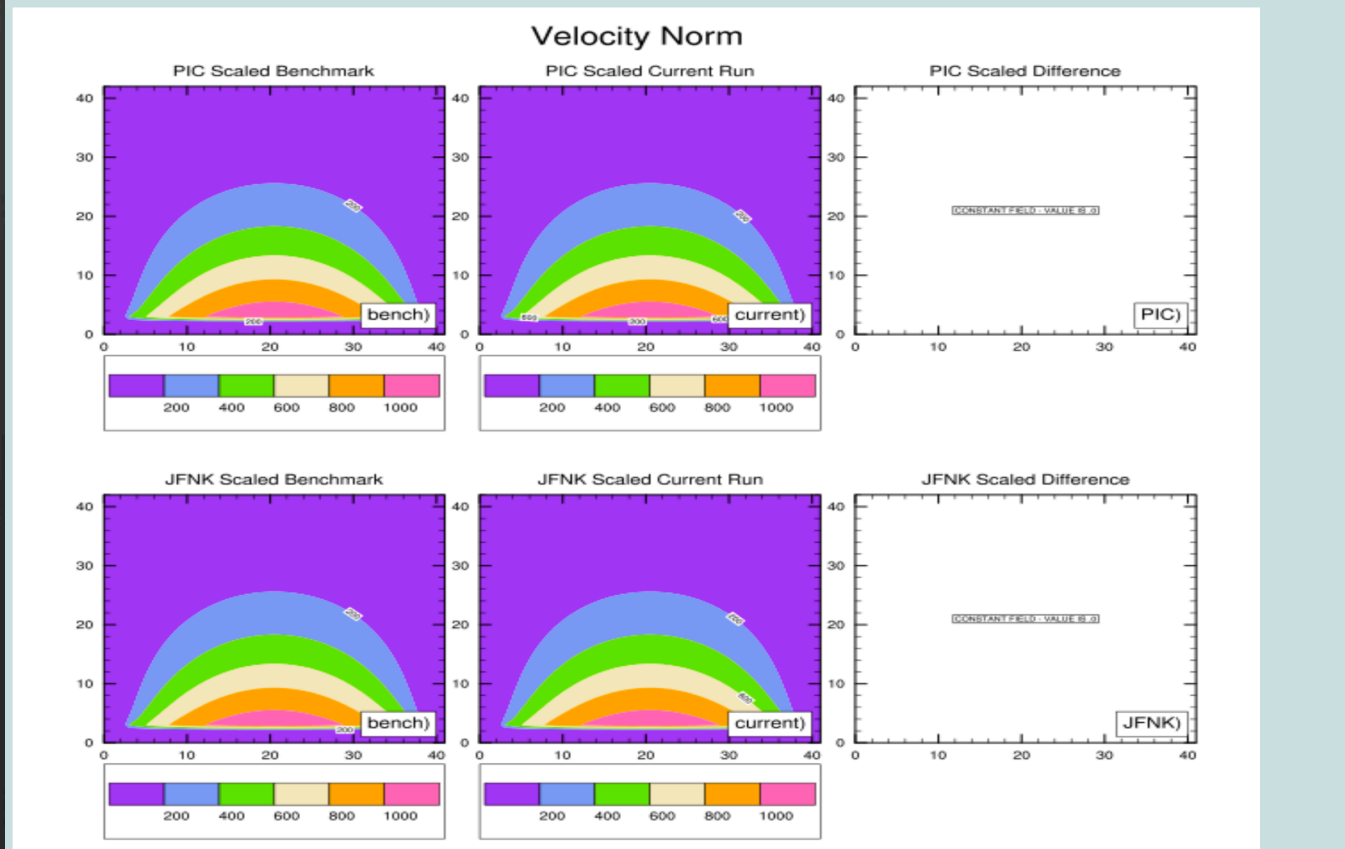

XML File Settings

Preconditioner: Picard
-----
Block GMRES: Convergence Tolerance = 1e-11
Block GMRES: Maximum Iterations = 100
Preconditioner Type = Ifpack
Prec Type = ILU
Overlap = 1
Fact: Level-of-Fill = 1

Solver: NK
-----
Newton: Jacobian Operator = Matrix-Free
Newton: Forcing Term Method = Type 2
Newton: Forcing Term Alpha = 2.0
Newton: Forcing Term Gamma = 0.10
```

Tri-Plots (Test, Benchmark, and Difference Plots)

Difference from Benchmark for Velocity Norm

Recently added features for verification

- ⊗ Added capability of selecting specific test cases to run within the bash scripts for LIVV
- ⊗ Added ismip hom a 20km test case with infrastructure for others
- ⊗ Include benchmarks from each machine run (titan, hopper, mac, rhel6)
- ⊗ LIVV automatically creates www directory and puts it in the html path so as not to interfere with user's other webpages
- ⊗ Comprehensive error messages, proceeding when appropriate
- ⊗ Improved label bars on contour plots

Performance V&V (pLIVV)

- ⊗ Development of automated information and metrics to evaluate performance of code
 - ⊗ Regression tests of performance changes
 - ⊗ Quantify performance changes due to new code features or bugs
- ⊗ Simple dome problem for a range of problem sizes to exercise scaling and performance behavior is included
 - ⊗ Dome 60,120,240,500,1000
 - ⊗ Extend to evolving dome
- ⊗ perf_test benchmark directory structured like reg_test
- ⊗ GIS 4km,2km,1km steady state have been run and created
 - ⊗ Next they will be added to perf_test
 - ⊗ Time stepping added when complete in FELIX (soon!)

Test Runs for Performance

- ❁ Dome 60 through Dome 1000 test cases (currently diagnostic, will eventually be evolving) to enable problem size scaling info
- ❁ Contains similar verification checks as with test problems
- ❁ Case run times are compared to a suite of runs on LCF systems, which are variable.

Less than the Min

Greater than the Max

- ❁ Runs of each case performed multiple times to create avg performance using offline scripts
- ❁ New runs are compared to the avg and max/min for individual model modules and highlighted if they are outside the range
- ❁ Performance behavior is much like climate behavior and so ensembles are useful

Initialization: Greenland Combined Data File

⊗ Data

⊗ Topography / bathymetry, thickness, upper surface, upper surface error: Bamber, J.L. et al., *The Cryosphere*, 2013

⊗ Basal Heat Flux: Shapiro, N.M. & Ritzwoller, M.H., *Earth & Plan. Sci. Lett.*, 2004

⊗ 2m Air Temp: Ettema J., et al., *Geophys. Res. Lett.*, 2009

⊗ 1km SMB, Racmo-generated

⊗ 500m Velocities and errors: Joughin, et al., *J. Glaciology*, 2010, [Updated in 2012]

⊗ Workflow for 1km files

⊗ Merge Bamber w/ Basal Heat Flux, 2m Air Temp, & SMB

⊗ Project velocity data to Bamber projection & interpolate

⊗ Optional hyper-diffusive filter

⊗ Selectively damp sharp gradients in thickness & upper surface

⊗ Reconstruct topography from thickness & upper surface

Solving with new initial datasets with the FELIX Dycore

- ⊗ Initial adjustment step of 4km, 2km, 1km GIS from initial state is very difficult to solve with CISM and is being completed successfully with FELIX
- ⊗ Like CISM, FELIX solves 'higher-order' version of Stokes
- ⊗ Need good results for validation (RACMO?)
- ⊗ Having time stepping option is a priority
- ⊗ CESM timers to FELIX and Trilinos have been added to provide consistent performance data format, these timers are now available on the mac version of the model

BISICLES is running on titan and within CISM so its next!

Norm of velocity 2km GIS

Near term work to extend and improve the software

- ⊗ Use benchmark performance data and pLIVV to conduct regular performance testing of BISICLES and FELIX for large-scale problems on NERSC and LCF platforms
- ⊗ Extend LIVV to include support for regular testing of additional CISM dycores
- ⊗ Extend LIVV to include support for regular testing of additional model configurations and test cases, including CISM runs coupled to CESM and ACME
- ⊗ Develop a model validation test case for Greenland, using time series of observed SMB and outlet glacier flux for model forcing and comparing model output to time series of observed surface elevation change

Validation Plans

- ⊗ Will be done now:
 - ⊗ Take output from standalone and coupled runs and create plots same as other model components in the coupled case in one place
 - ⊗ Adapt plots to be maximally useful to CISM folks (i.e. zoom on over high latitudes)
- ⊗ Will be done next:
 - ⊗ Take list from Jeremy's tale this AM for the model and add anything not yet captured
- ⊗ Will be done extending forward
 - ⊗ Add in comparisons to data and regional models as available
