16 February 2015

# Modeling climate change impacts on air quality

Socioeconomic emissions scenario

General circulation models

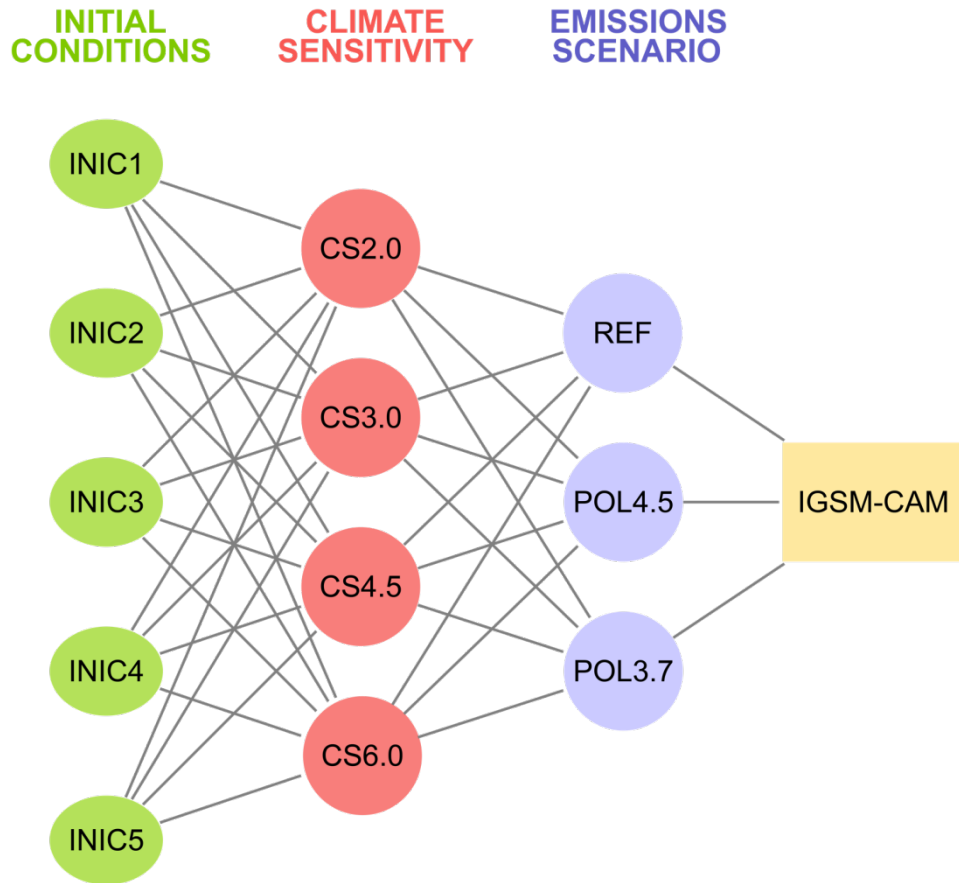

Global and regional atmospheric chemistry-transport models

- **Uncertainty and variability** are associated with climate simulations and propagate to projections of air quality
- Characterizing uncertainty across the complete human-climate system is essential to generate policy-relevant insights

# Ensemble simulation of 21<sup>st</sup> century climate change

We focus on the 3 main sources of uncertainty in climate projections:

1. Emissions scenario:
  - Reference: No policy  
2100 radiative forcing =  $9.7 \text{ W/m}^2$
  - Policy 4.5: Stabilization  
2100 radiative forcing =  $4.5 \text{ W/m}^2$
  - Policy 3.7: Stringent stabilization  
2100 radiative forcing =  $3.7 \text{ W/m}^2$
2. Climate model response [1]
  - Climate sensitivity =  $2.0^\circ\text{C}$ ,  $3.0^\circ\text{C}$ ,  $4.5^\circ\text{C}$  or  $6.0^\circ\text{C}$
3. Natural variability
  - Multidecadal simulations
  - 5 different initializations

# Air quality modeling framework

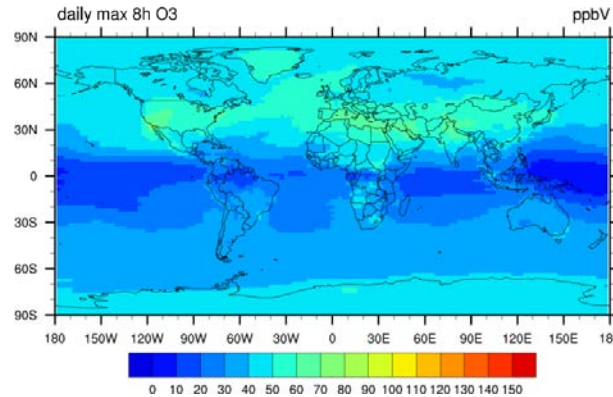

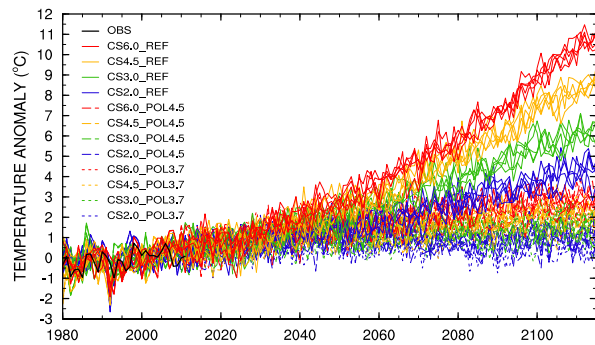

MIT IGSM

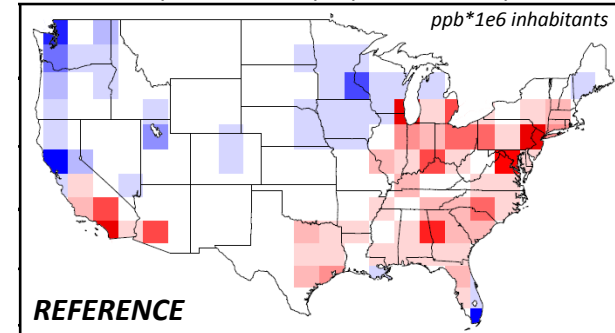

CESM

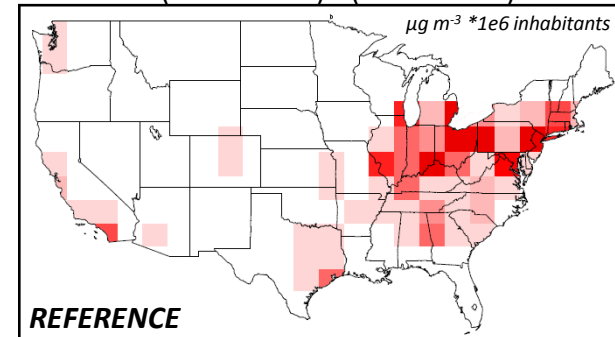

BenMAP

$\Delta$  Annual-avg. pop.-weighted  $O_3$   
(2085–2115) - (1980–2010)

$\Delta$  Annual-avg. pop.-weighted  $PM_{2.5}$   
(2085–2115) - (1980–2010)

**MIT IGSM:** Policy scenarios and climate projections

**Community Earth Systems Model (CESM):**

Global atmospheric chemistry and air quality

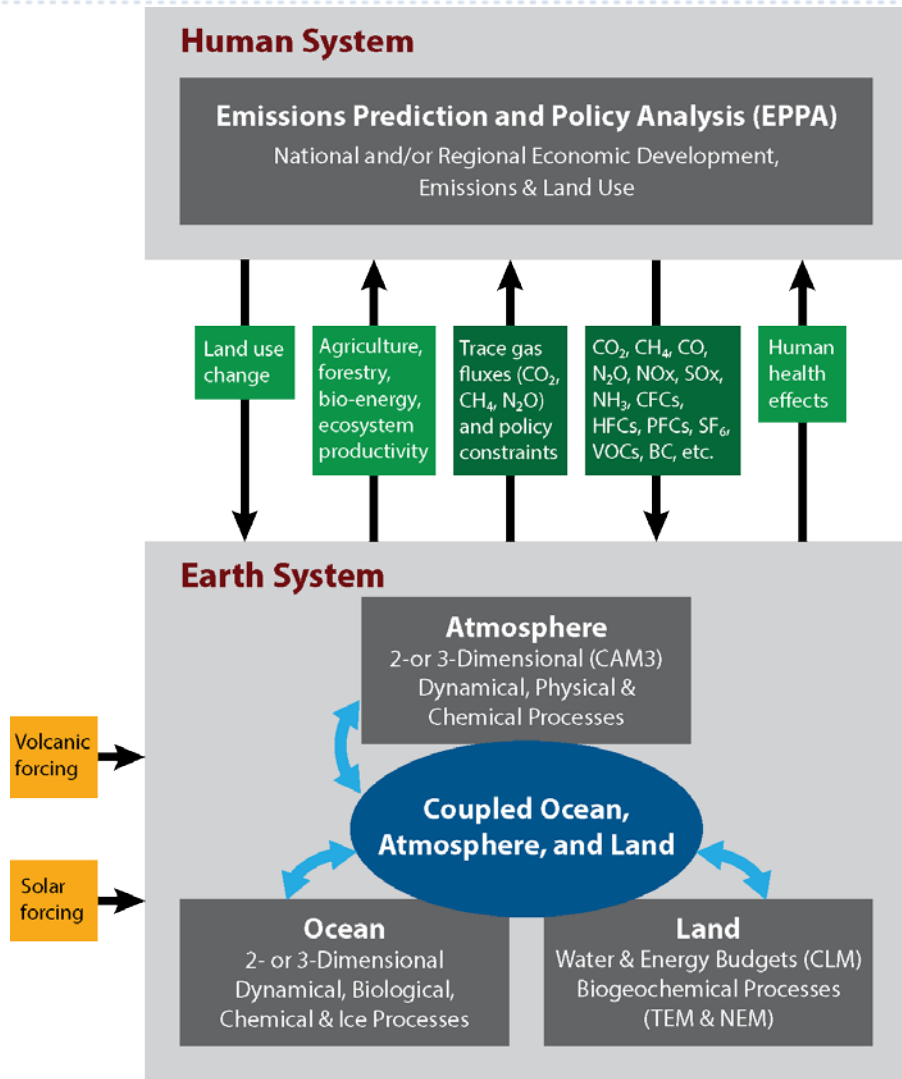

**Env. Benefits Mapping & Analysis Program (BenMAP):**

Health and economic impacts

- *Atmospheric emissions fixed at yr-2000 levels to estimate climate penalty on air quality*
- *30-yr simulations used to characterize climate (1981→2010, 2036→2065, 2085→2115)*

# Climate and policy scenarios

## MIT Integrated Global System Model:

Two major coupled components:

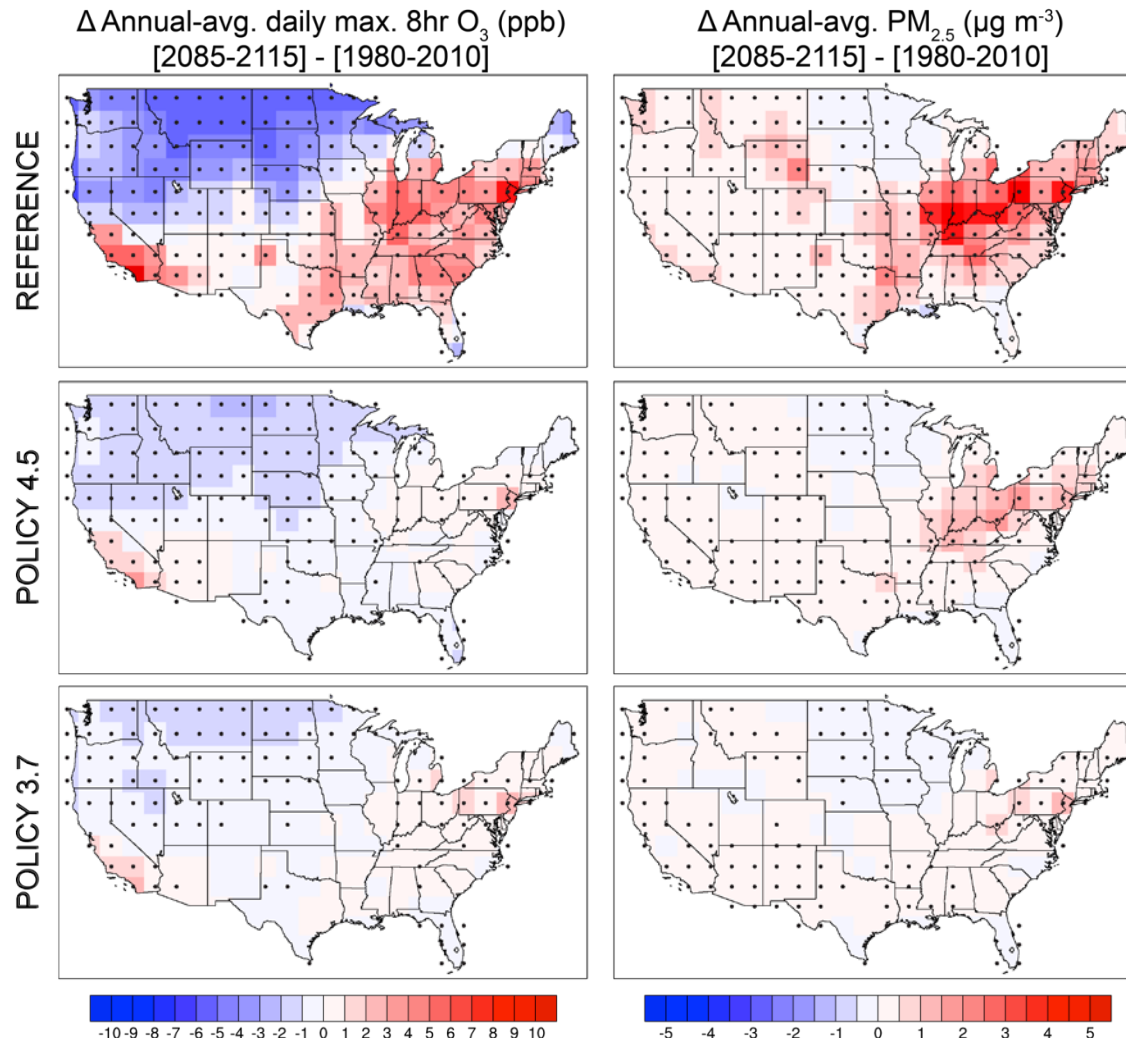

- Earth system model
- Economic projection and policy analysis model

Important features:

- Single consistent framework for greenhouse gas emissions policy and climate change scenarios
- Ability to alter climate system response
- Computationally efficient

# Climate penalty on U.S. air quality

# Climate penalty and policy benefits for U.S. O<sub>3</sub>

US-average population-weighted daily max. 8hr O<sub>3</sub>:

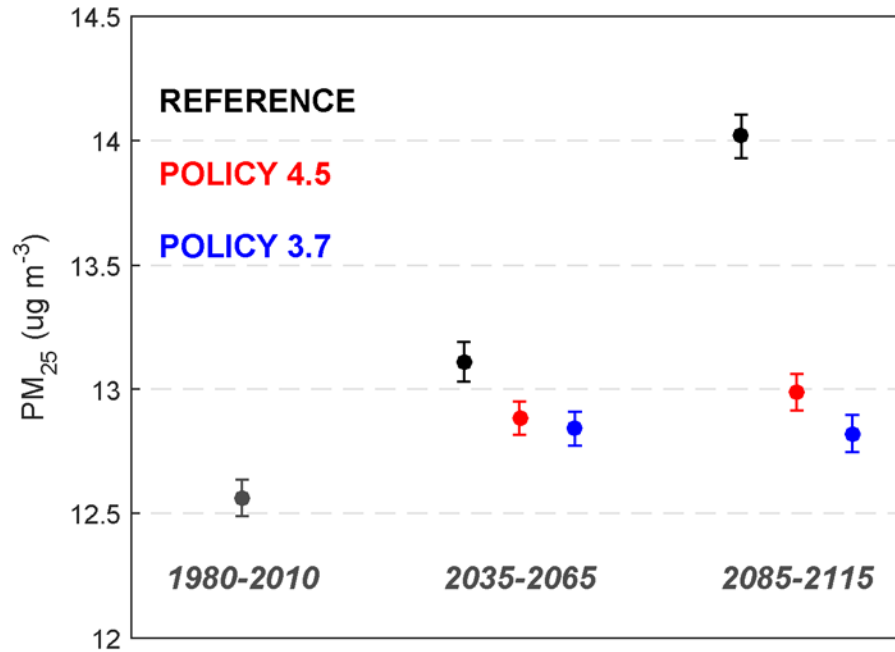

Climate Penalty (ppb)		Annual avg. daily max. 8-hr O <sub>3</sub>	Summer avg. daily max. 8-hr O <sub>3</sub>
REF	2000 → 2050	0.8 ± 0.3	3.4 ± 0.7
	2000 → 2100	3.2 ± 0.3	10.4 ± 0.7
POL45	2000 → 2050	0.4 ± 0.2	2.0 ± 0.6
	2000 → 2100	0.4 ± 0.2	2.3 ± 0.6
POL37	2000 → 2050	0.3 ± 0.3	1.6 ± 0.7
	2000 → 2100	0.6 ± 0.3	2.3 ± 0.6

Policy Impacts (ppb)		Annual avg. daily max. 8-hr O <sub>3</sub>	Summer avg. daily max. 8-hr O <sub>3</sub>
REF → P45	2050	-0.5 ± 0.3	-2.0 ± 0.7
	2100	-2.9 ± 0.3	-8.7 ± 0.7
REF → P37	2050	-0.5 ± 0.3	-2.1 ± 0.7
	2100	-2.6 ± 0.3	-8.3 ± 0.7

# Climate penalty and policy benefits for U.S. PM<sub>2.5</sub>

US-average population-weighted PM<sub>2.5</sub> ( $\mu\text{g m}^{-3}$ ):

Climate Penalty ( $\mu\text{g m}^{-3}$ )		Annual avg. PM <sub>2.5</sub>
REF	2000 → 2050	0.5 ± 0.1
	2000 → 2100	1.5 ± 0.1
POL45	2000 → 2050	0.3 ± 0.1
	2000 → 2100	0.4 ± 0.1
POL37	2000 → 2050	0.2 ± 0.1
	2000 → 2100	0.2 ± 0.1

Policy Impacts ( $\mu\text{g m}^{-3}$ )		Annual avg. PM <sub>2.5</sub>
REF → P45	2050	-0.2 ± 0.1
	2100	-1.0 ± 0.1
REF → P37	2050	-0.3 ± 0.1
	2100	-1.2 ± 0.1

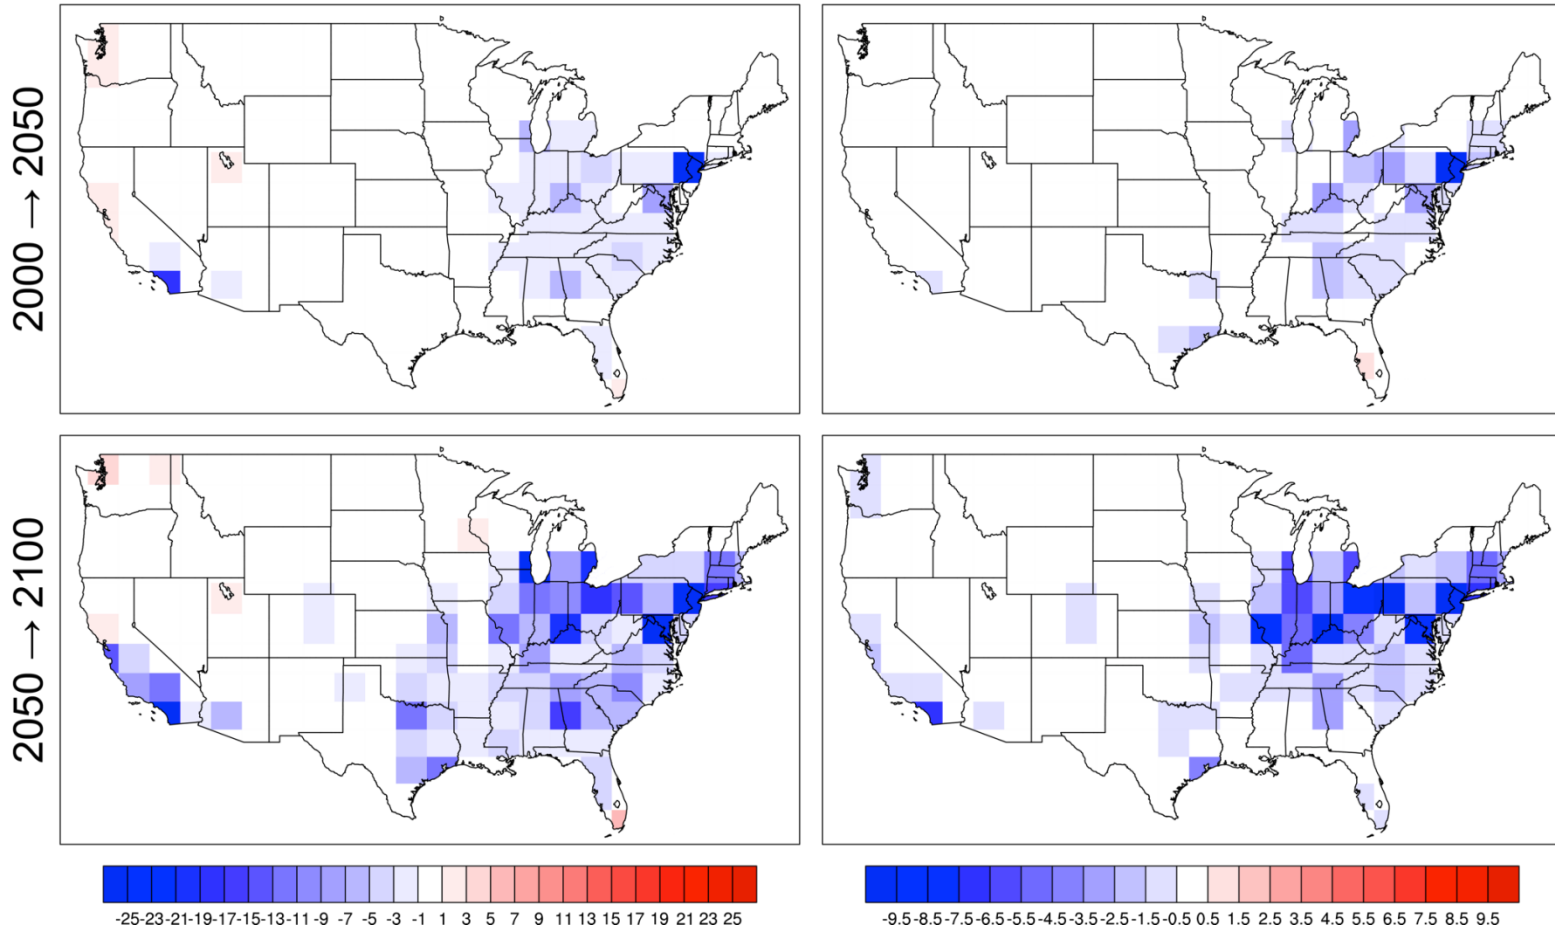

# Emissions scenario

Avoided annual climate penalty under stabilization scenario P45 relative to Reference:

Daily max 8hr O<sub>3</sub> (ppb × 10<sup>6</sup> inhabitants)

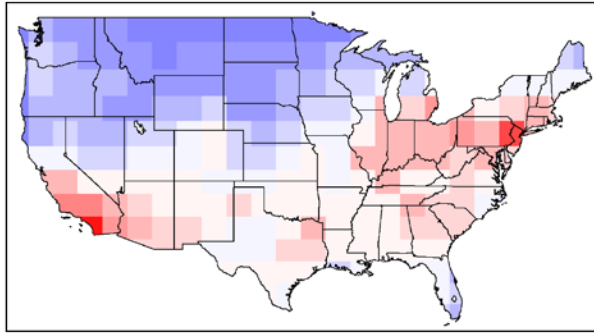

PM<sub>2.5</sub> (μg m<sup>-3</sup> × 10<sup>6</sup> inhabitants)

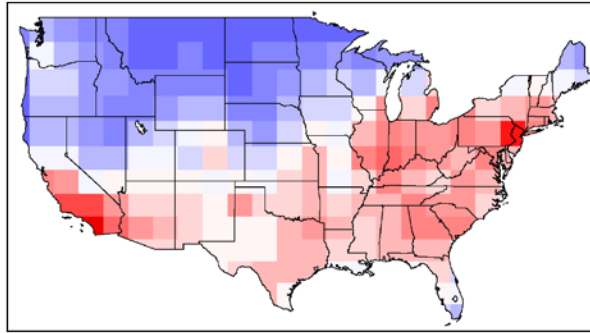

# Climate model response

Climate penalty on annual daily max. 8hr O<sub>3</sub> and average PM<sub>2.5</sub>  
from 2000 to 2100 under Reference scenario:

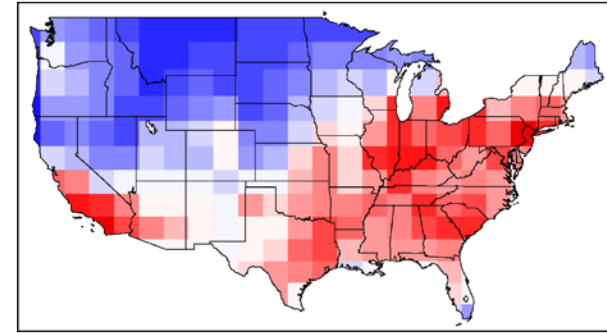

Climate Sensitivity = 2.0°C

Climate Sensitivity = 3.0°C

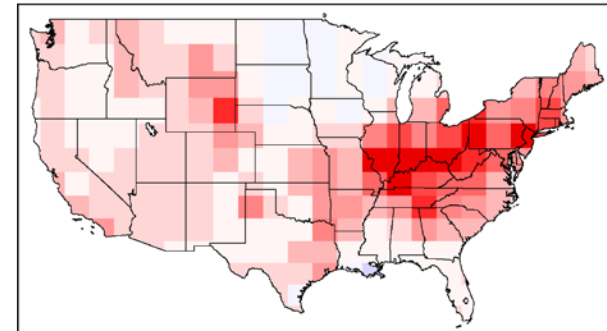

Climate Sensitivity = 4.5°C

-10 -9 -8 -7 -6 -5 -4 -3 -2 -1 0 1 2 3 4 5 6 7 8 9 10

Δ O<sub>3</sub> (ppb)

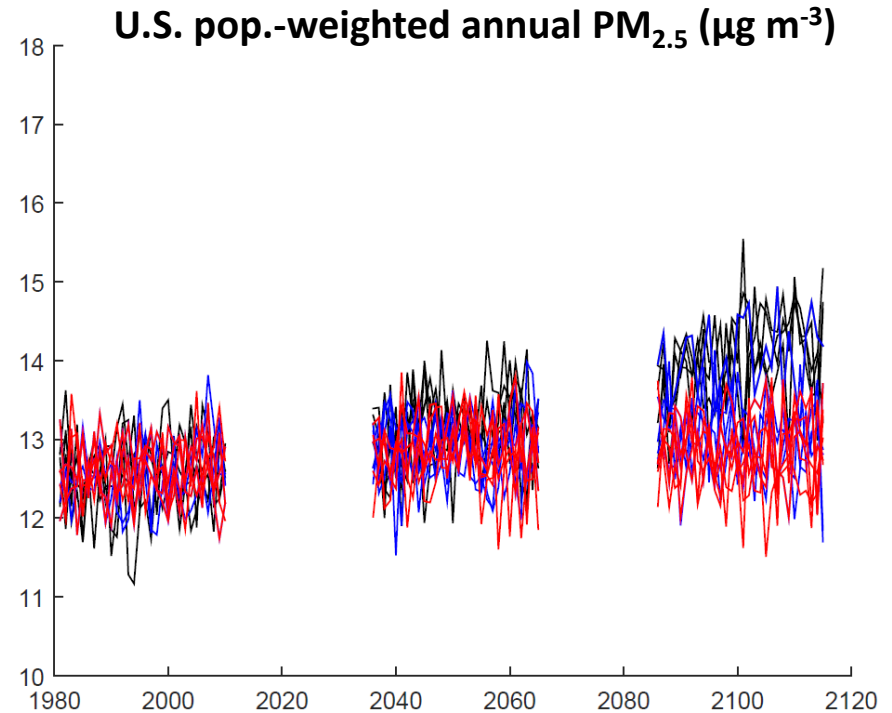

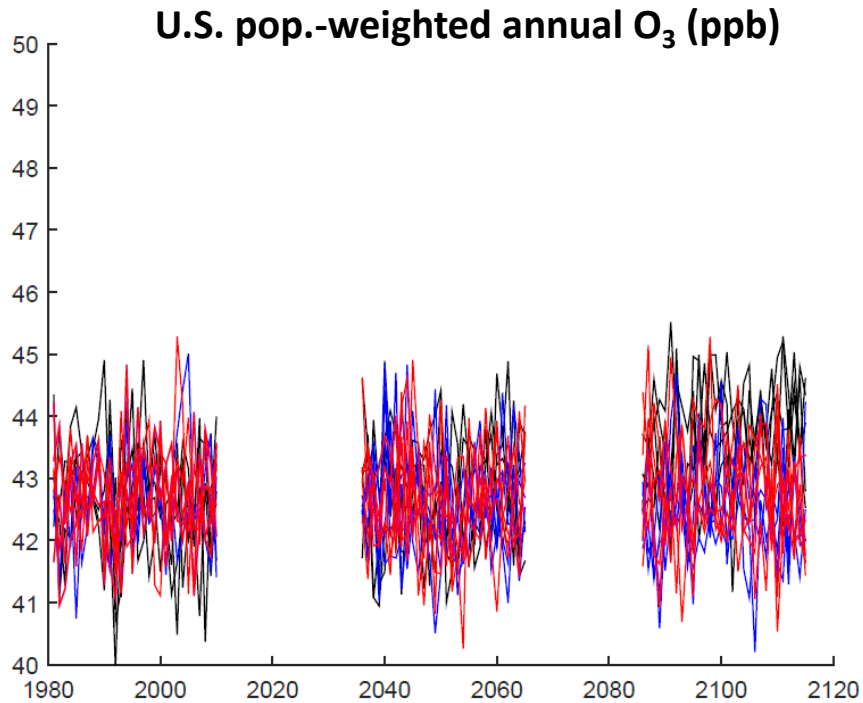

Δ PM<sub>2.5</sub> (μg m<sup>-3</sup>)

-5 -4 -3 -2 -1 0 1 2 3 4 5

# Internal variability in U.S. air quality projections

**Reference**

**Policy 4.5**

**Policy 3.7**

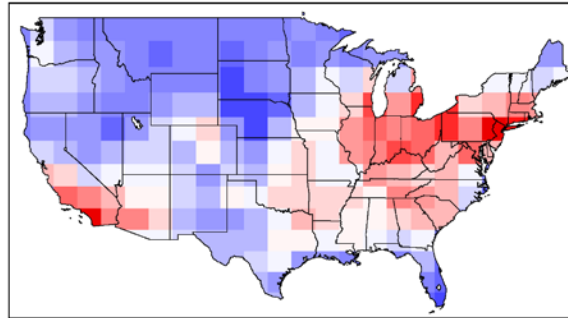

# Influence of natural variability

Climate penalty on annual-average daily max. 8hr ( $\Delta$  ppb) from 2000 to 2100 under Reference scenario estimated from 1-year simulations:

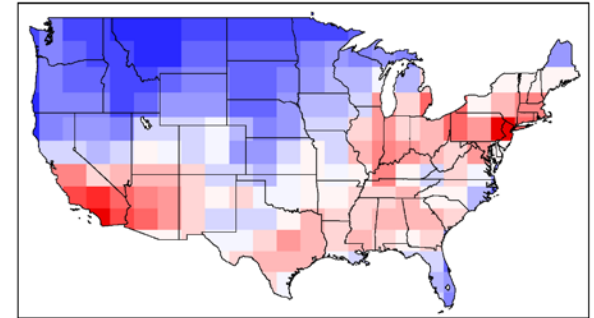

IC1

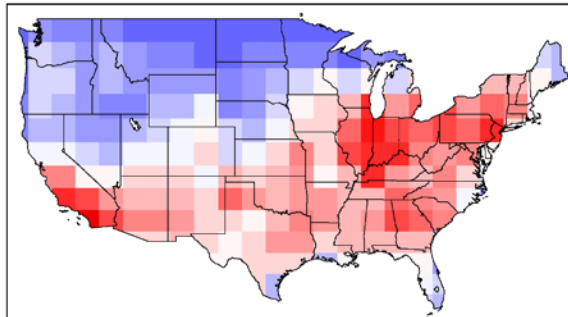

IC2

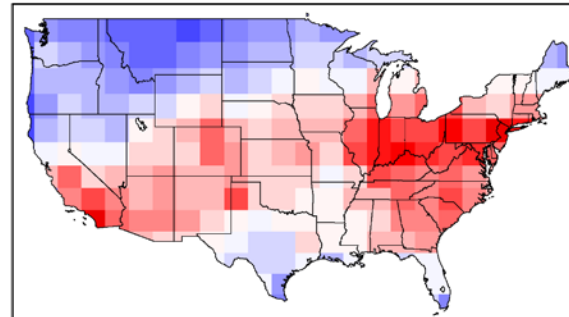

IC3

IC4

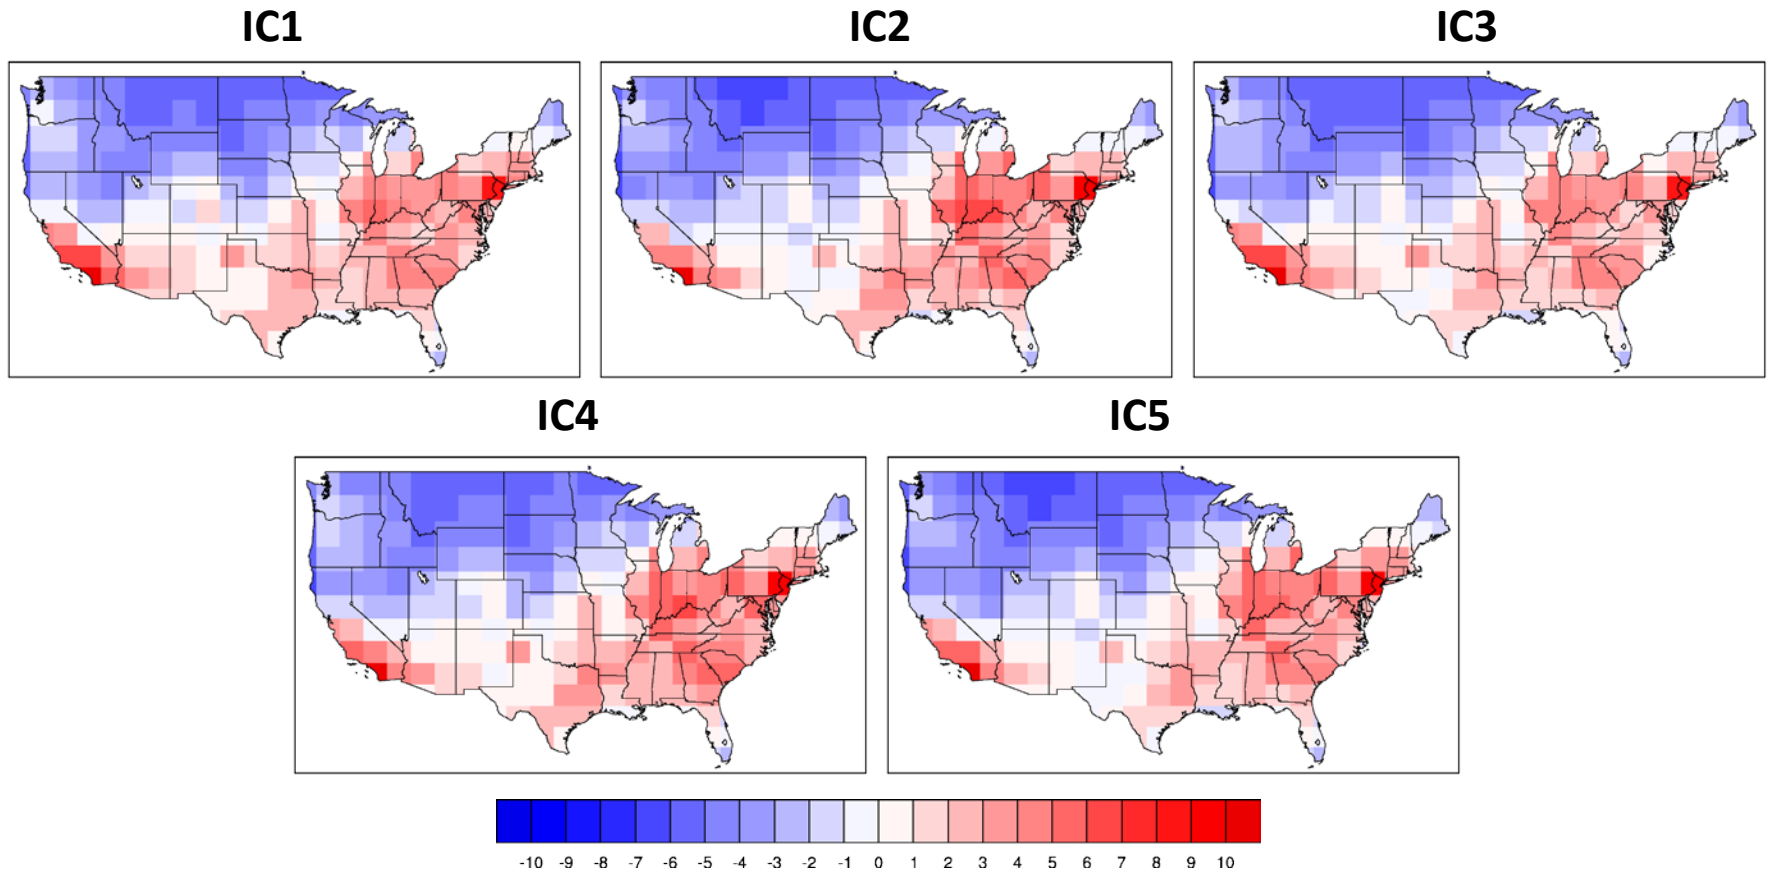

IC5

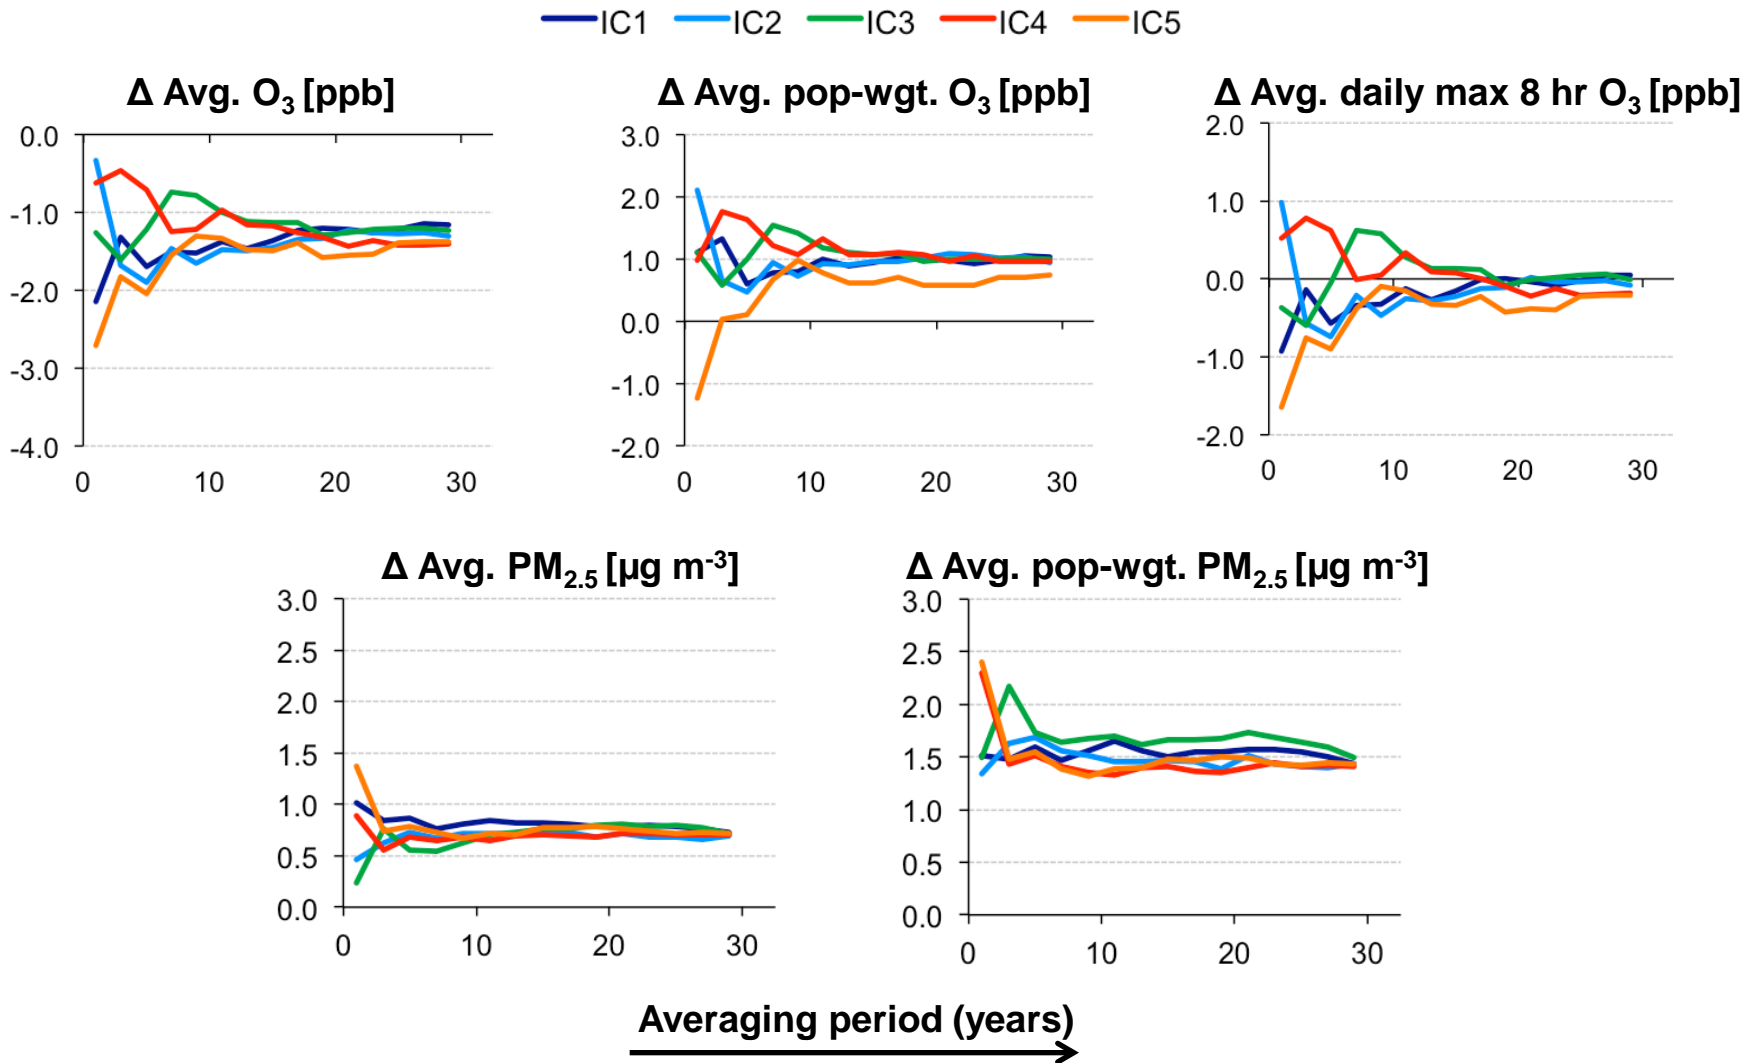

# Considering variability in air quality projections

Climate penalty on annual-average daily max. 8hr ( $\Delta$  ppb) from 2000 to 2100 under Reference scenario estimated from 30-year simulations:

# Considering variability in air quality projections

# Climate uncertainty in air quality impacts assessments

---

- Substantial uncertainties associated with climate projections significantly influence simulations of future air quality.
- Beyond anthropogenic emissions scenarios, large uncertainty associated with natural variability and climate model response.
- Simulations > 15 years may be needed to capture anthropogenic-forced climate signal.
- Projections of climate change impacts before 2050 remain considerably uncertain.
- Propagation of uncertainty is stronger for regional-scale impacts and extremes.
