

# Using Landscape Typologies to Model Socioecological Systems

**Sujith Surendran Nair**  
**Ben Preston**  
**Anthony King**  
**Rui Mei**

Using landscape typologies to model socioecological systems: Application to agriculture of the United States Gulf Coast.  
Submitted to Environmental Modeling and Software

# Hierarchical clustering to create typologies

**Cluster Intersection and Clipping**

**Socioecological Typologies**

**Regional Production Function**

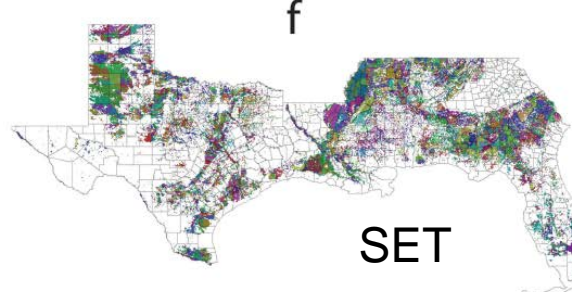

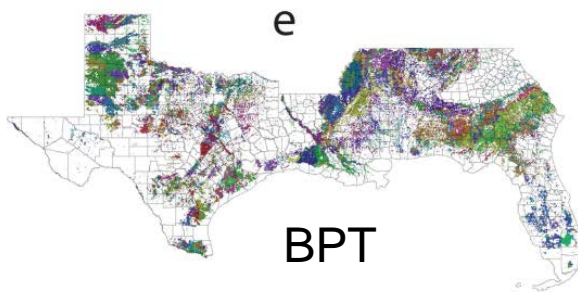

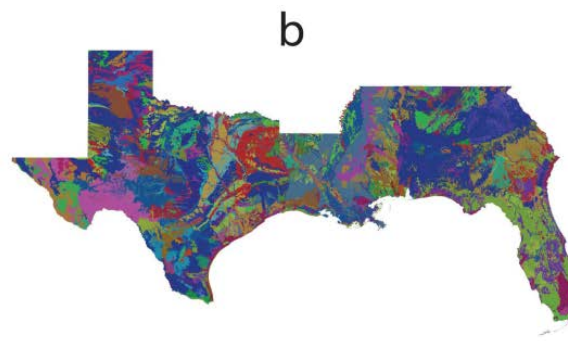

# Input variables for clustering

<u>Variables</u>	<u>Time Span</u>	<u>Data Source</u>
<b>Climate</b> (30 years monthly, growing-season and annual mean and standard deviations at 18 km <sup>2</sup> grid)	1981-2010	DayMet
<b>Soil (Components in map unit key)</b>		STATSGO
<b>Topography</b> (Average and standard deviation HUC-12 watersheds)		NED, USGS
<b><u>Socioeconomic Variables (County)</u></b>		
Size of farm holding	1982-2007	Agriculture Census, USDA
Farm production intensity	1986-2010	NASS-USDA and US BEA
Farm specialization	1986-2010	NASS-USDA and US BEA
Total factor productivity	1986-2010	InSTePP Database
Population and population density	1986-2010	US Census Bureau
Road connectivity	1990-2010	US Census Bureau
Household income	1986-2010	US Census Bureau, American Community Survey
Unemployment	1986-2010	US Census Bureau
Education	1986-2010	US Census Bureau

# Mapped typologies

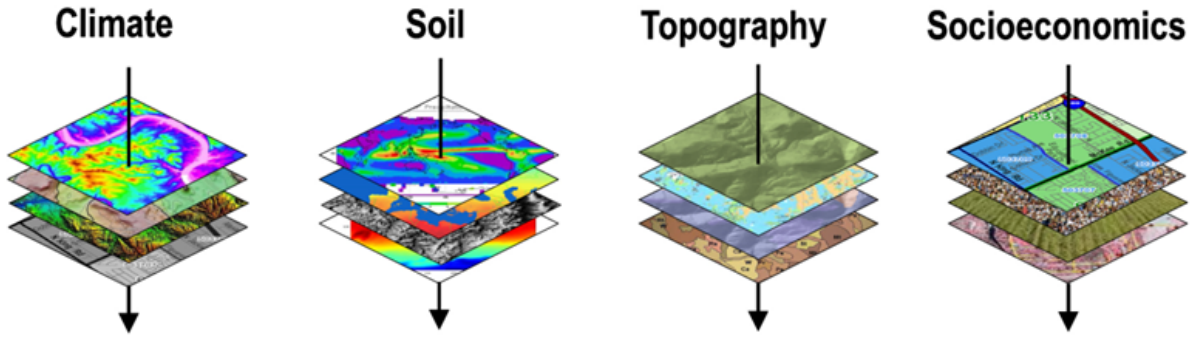

## Typologies

- a. Climate
- b. Soil
- c. Topography
- d. Socioeconomic
- e. Bio-Physical (BPT)
- f. Socio-Ecological (SET)

2,410 unique BPT types  
4,429 unique SET types

# Regression modeling with types as predictor variables

Cluster Intersection and Clipping

Socioecological Typologies

Regional Production Function

BPT model

$$Y_{\text{corn}} = F_{\text{linear}}(\text{types})$$

SET model

# Results from BPT and SET models for corn yield

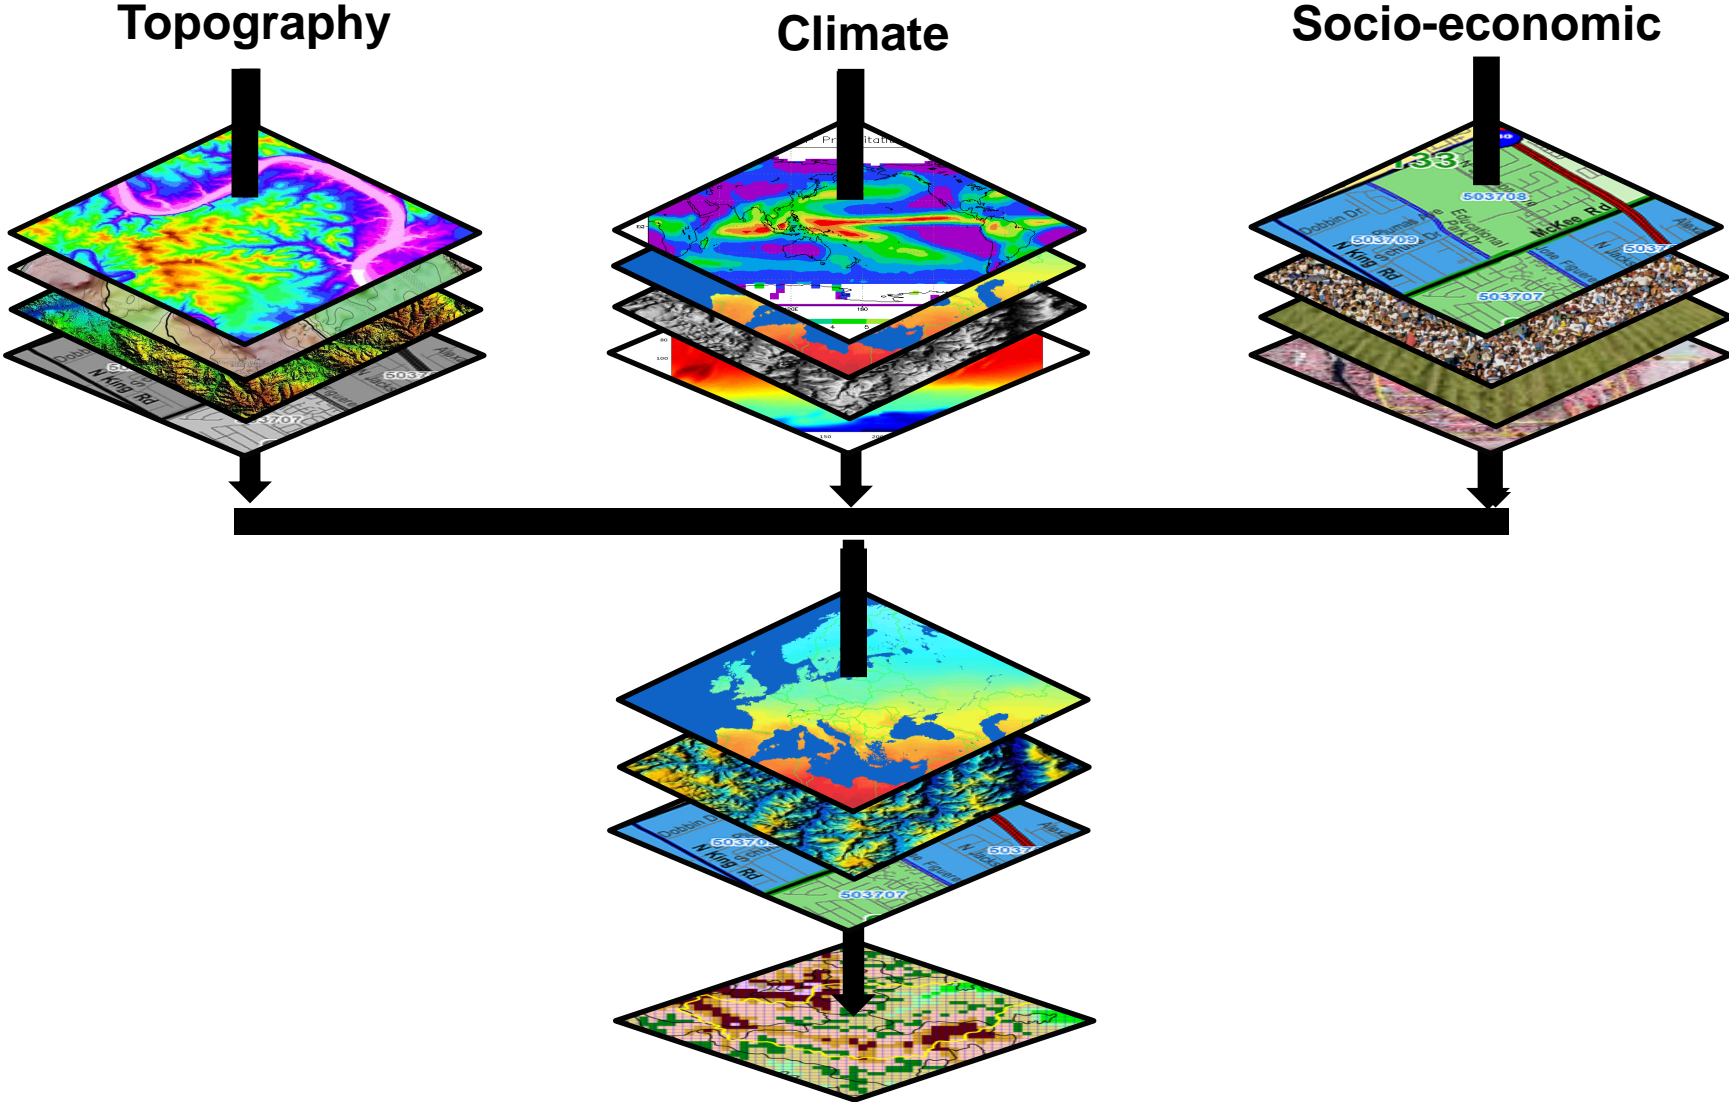

Property	BPT	SET
Adjusted R <sup>2</sup>	0.72	0.89
Share of typologies <sup>†</sup> (%)		
Climate	55	38
Soil	33	17
Topography	12	8
Socioeconomic		37
Number of types dropped from BPT and new types added to SET		
Climate	6	18
Soil	4	3
Topography	3	1
Socioeconomic		37
Friedman's Two-way Analysis of Variance <sup>‡</sup>		
Observed Corn Yield	19.92	0.05
BPT vs. SET		13.92
Partial F test <sup>††</sup>		114.44

# Results from BPT and SET models for corn yield

Property	BPT	SET	Including socioeconomic variables explained more of the regional spatial variation in 25-year mean corn yields
Adjusted R <sup>2</sup>	0.72	0.89	
Share of typologies <sup>†</sup> (%)			
Climate	55	38	
Soil	33	17	
Topography	12	8	
Socioeconomic		37	
Number of types dropped from BPT and new types added to SET			
Climate	6	18	
Soil	4	3	
Topography	3	1	
Socioeconomic		37	
Friedman's Two-way Analysis of Variance <sup>‡</sup>			
Observed Corn Yield	19.92	0.05	
BPT vs. SET		13.92	
Partial F test <sup>††</sup>		114.44	

# Social Vulnerability: loss to climate hazards

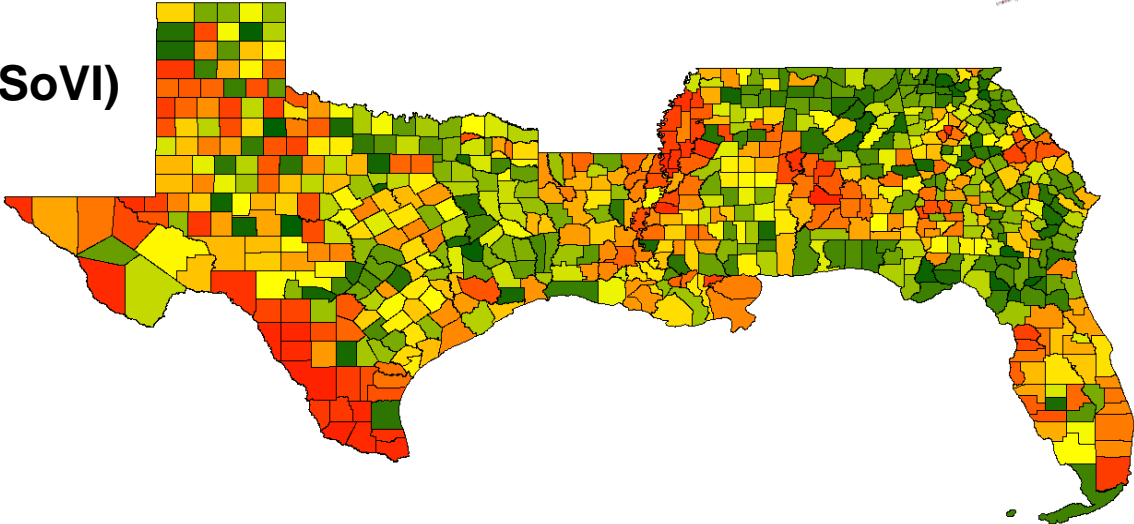

# Social Vulnerability

## Socioecological Typology

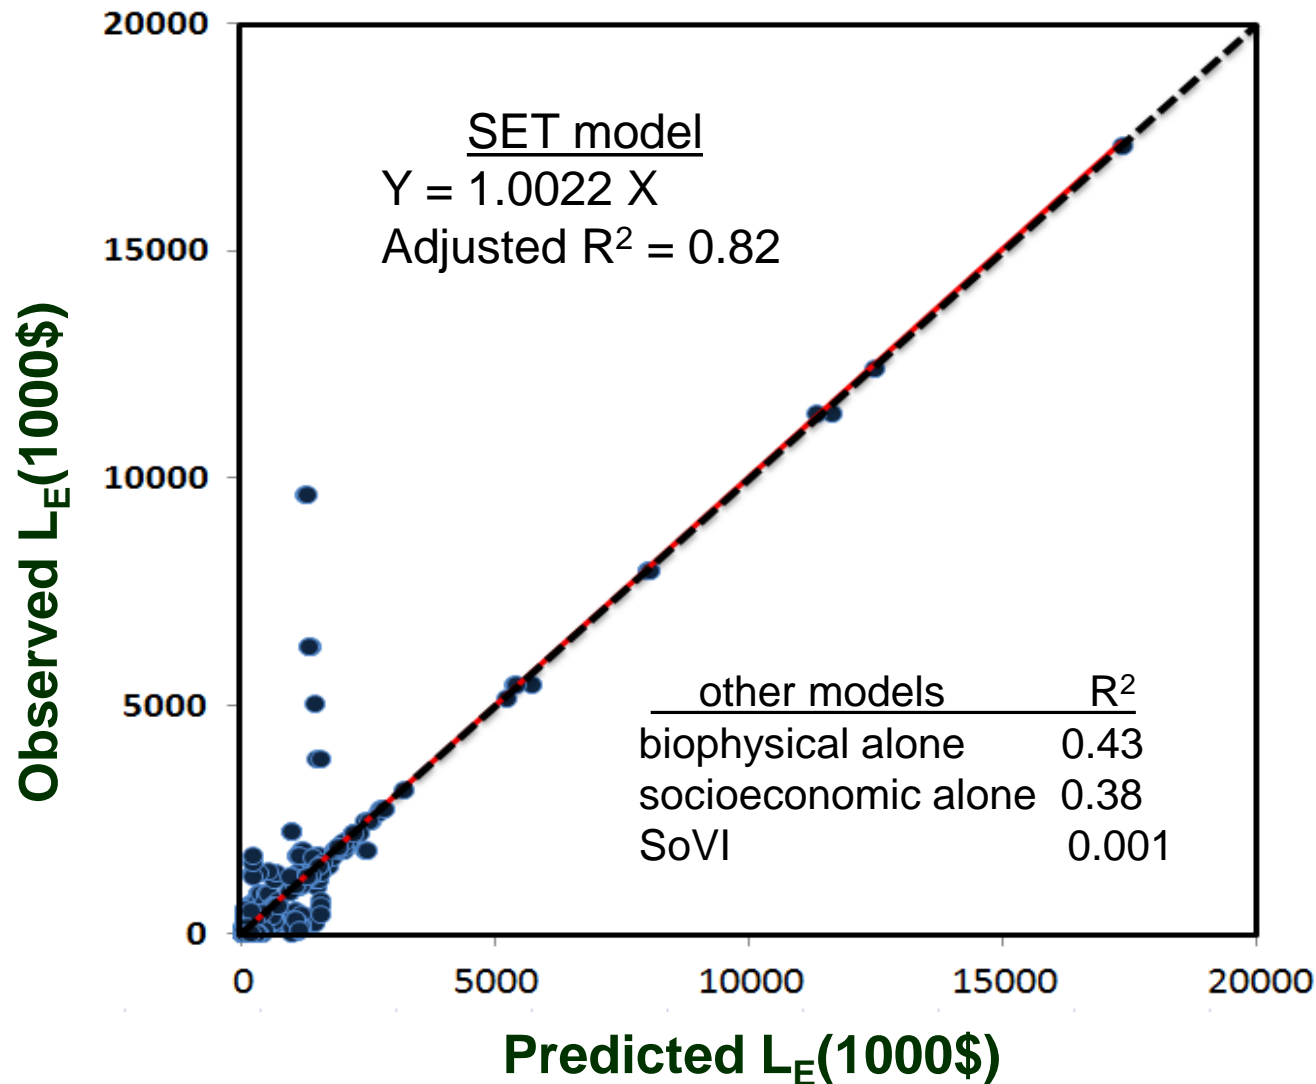

Unique SETs

## Social Vulnerability Index (SoVI)

# Predicting economic loss from climate hazards ( $L_E$ )

So...

# So... typologies and CESM

1. Attribution might inform choice of variables for:
  - a. Scenarios of future socioeconomic forcings
  - b. Endogenous variables in CESM >2
  
2. Post processing of CESM projections:
  - a. Typological differences
    - how does a future typology compare with the historic BPT straightforward, but future SET will be constrained by projection of socioeconomic variables
  - b. Use future typology with the historical empirical model to project future values for the target variable
  - c. Evaluate functional responses --- does the relationship between target variable and typology in the future match the historical
  
3. Use types within CESM --- analogous to plant functional types

# Relevance to SDWG

- Fostering dialogue ✓
- Needs for CESM development ( CESM >2)
  - expanded socioeconomic scenarios
  - endogenous socioeconomic variables
- Relevant CESM simulations (if used in post-processing/analysis of results):
  - those with projected agricultural yields
  - any with future extreme events/hazards
- New CESM linkage code ?
