**CESM AMWG**  
**NCAR 8-10 Feb. 2016**

# NorESM belongs to the “family” of models based on the **Community ESMs.**

- **The ocean model** → iso-pycnic co-ordinate, developed from MICOM;
- **Ocean bio-geochemistry** is based on HAMOCC (HAMBurg Ocean Carbon Cycle Model);
- **Aerosol life-cycling, physics, and interactions with clouds** (CAM-Oslo);
- Adjusted processing of sea-ice and **snow on sea-ice.**

## NorESM2\_CAM – the CMIP6-versions

- intended to be based on **CESM1.5 / CAM5.5** or newer.
- **preliminary version** is based on **CESM1.2\_CAM5.3**.
  - But: CICE5 and CLM5 are needed in NorESM2
- Alternative:
  - trace-back CAM5.3 / 5.4 from CESM1.5\_CAM5.5,
  - e.g. with 48 levels
  - and WACCM stratospheric physics  
(→QBO, SSW possible impacts on tropospheric dynamics)
- A version based on CESM2\_CAM6 to be considered later
- The MICOM-based Ocean model can be run with 1x1 deg and 0.25x0.25 deg resolution

# Sea ice component in NorESM2

- **The sea ice component based on CICE5**
  - Most likely with prognostic sea-ice salt.
  - Possibly include changes in the horizontal distribution of snow on sea ice, and a simple parameterization of the effects of wind blowing snow.

# NorESM-Ocean Resolution

Based on monthly snapshots from early NorESM2 tests where NorESM-O was coupled to standard CAM5.3

1 degree

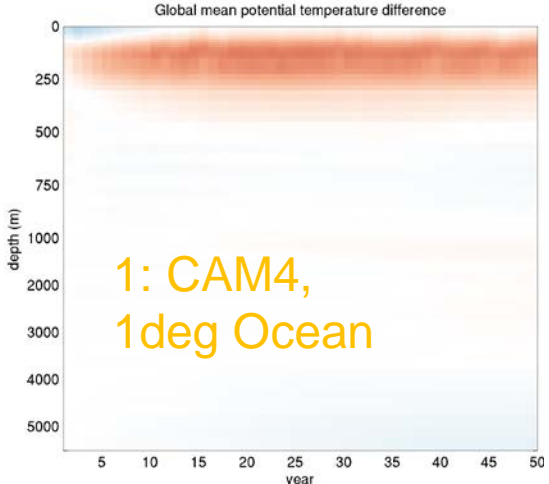

1/4 degree

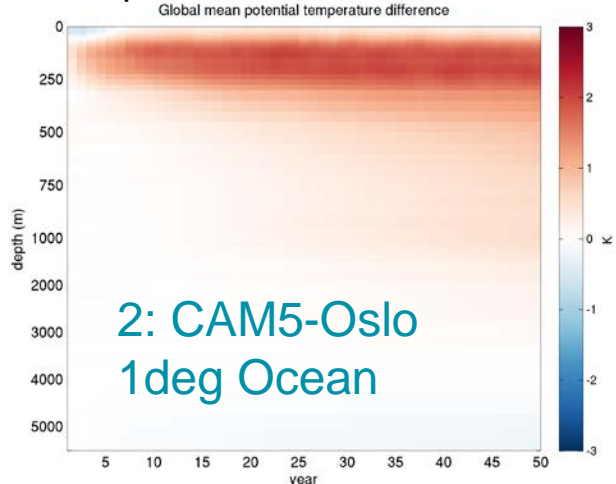

# Experience from NorESM2 coupled experiments with 1° and 0.25° ocean resolution

Global Mean Ocean pot. temp. difference.

N1850\_f19\_tn11\_01\_default

# Remarks on Status for NorESM2

## CMIP DECK:

**NorESM2\_MH** ( or **\_MM**) should be ready by end 2016/early 2017  
ScenarioMIP, AerChemMIP, DAMIP

**NorESM2\_LM & LME** should be ready before summer 2017.  
ScenarioMIP, C4MIP, DAMIP, LUMIP, LS3MIP, AerChemMIP

# Important aerosol related updates: CAM4-Oslo → CAM5-Oslo:

- 1) “Oslo aerosols” as an option alongside CAM5’s MAMx
- 2) Explicit treatment of aerosols in cloud-water
- 3) New sea-salt emission parametrization (Salter et al., 2015)
- 4) Terrestrial BVOC-emissions from CLM4.5 → SOA
- 5) Explicit aerosol nucleation of H<sub>2</sub>SO<sub>4</sub> + SOA
- 6) Online oceanic biogenic POM and DMS emissions
- 7) Improved heterogeneous ice nucleation treatment
- 8) Conservation of energy-consistency – fix implemented
- 9) Several bug fixes since CAM4-Oslo (alas!)
- 10) Nitrate aerosols: in progress

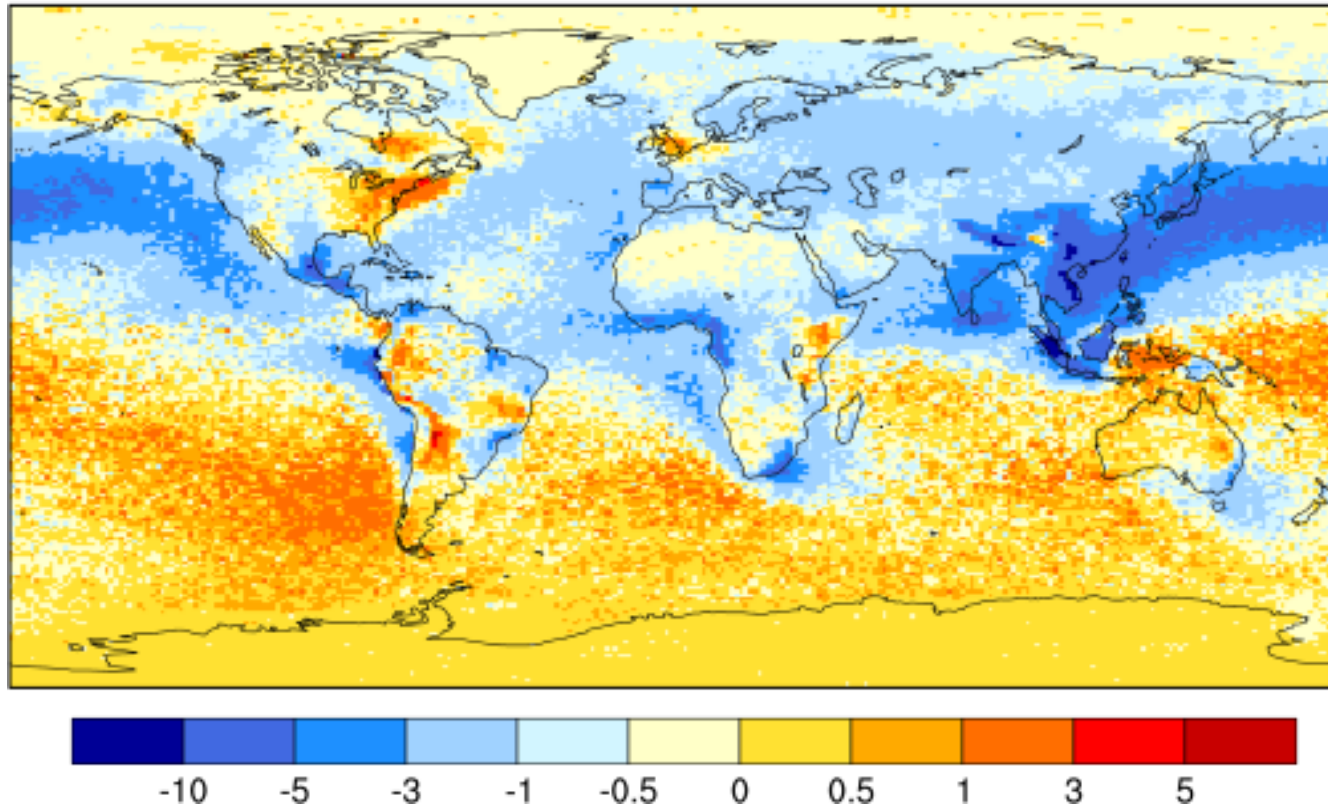

# Indirect RF in CAM4-Oslo vs. ERF ACI in CAM5-Oslo ( $W m^{-2}$ ):

(Only minor changes in direct radiative forcing, ca.  $-0.1 - 0.0 W m^{-2}$ )

	SW	LW	Main new features/bug-fixes
<b>CAM4-Oslo</b> (Ind. RF)	<b>-0.91</b>	<b>+0.01</b>	<b>(Indirect RF; NorESM1 for CMIP5)</b>
<b>CAM5.3-Oslo</b> <b>ERF ACI</b>	<b>-0.92</b>	<b>+0.14</b>	<b>Most recent CAM5.3-Oslo version</b>
	-1.27	+0.22	New emissions, chemistry and aerosol cloud interactions, assumed hygroscopicity for CCN activation, and b.b. OM/OC=1.4 (reduced from 2.6)
	-1.16	+0.22	New sea-salt parameterization
	-1.46	+0.26	Bug-fixes for aerosol condensation, halved dust emissions
	-1.82	+0.34	On-line terrestrial BVOC → SOA life-cycling
	-1.71	+0.41	New Ice-Nucleation scheme and daily oxidants
	-1.20	+0.33	On-line DMS & oceanic biogenic POM

SW cloud radiative forcing at TOA

avg =  $-0.917 \text{ W m}^{-2}$

### Hypotheses studied:

- Nucleation over oceans is high in PI due to inefficient condensation combined with large BVOC emissions upwind.
  - In NH, this is compensated by large PD  $\text{SO}_2$ -emissions.
- Organic aerosols influence sea salt hygroscopicity
- Feedback to DMS emissions
- Different oxidant levels in PD and PI

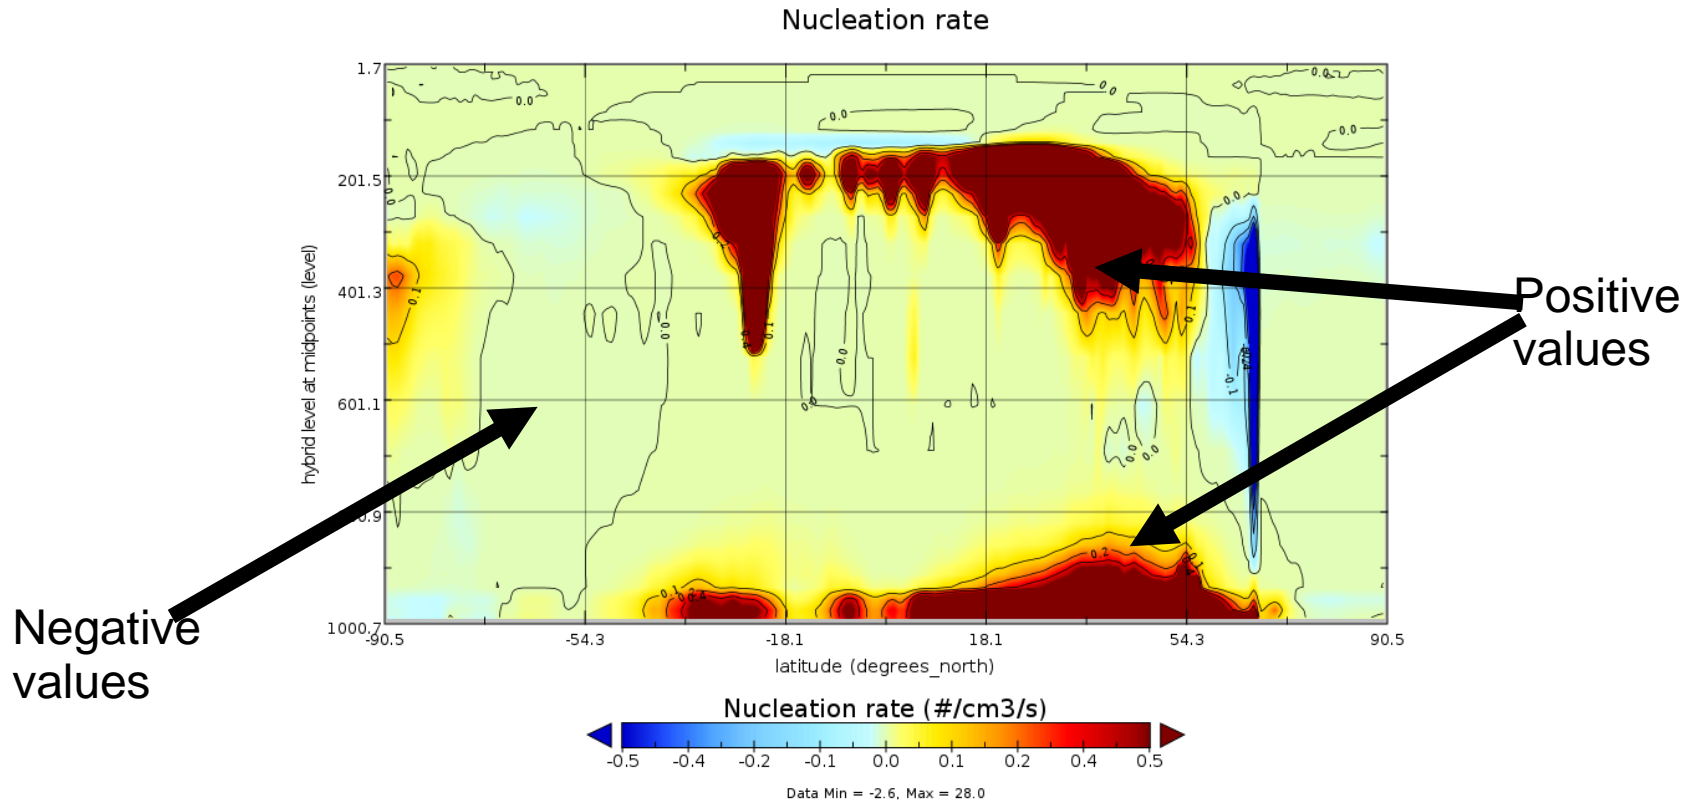

Norwegian  
Meteorological  
Institute

**Thank you for the attention.**

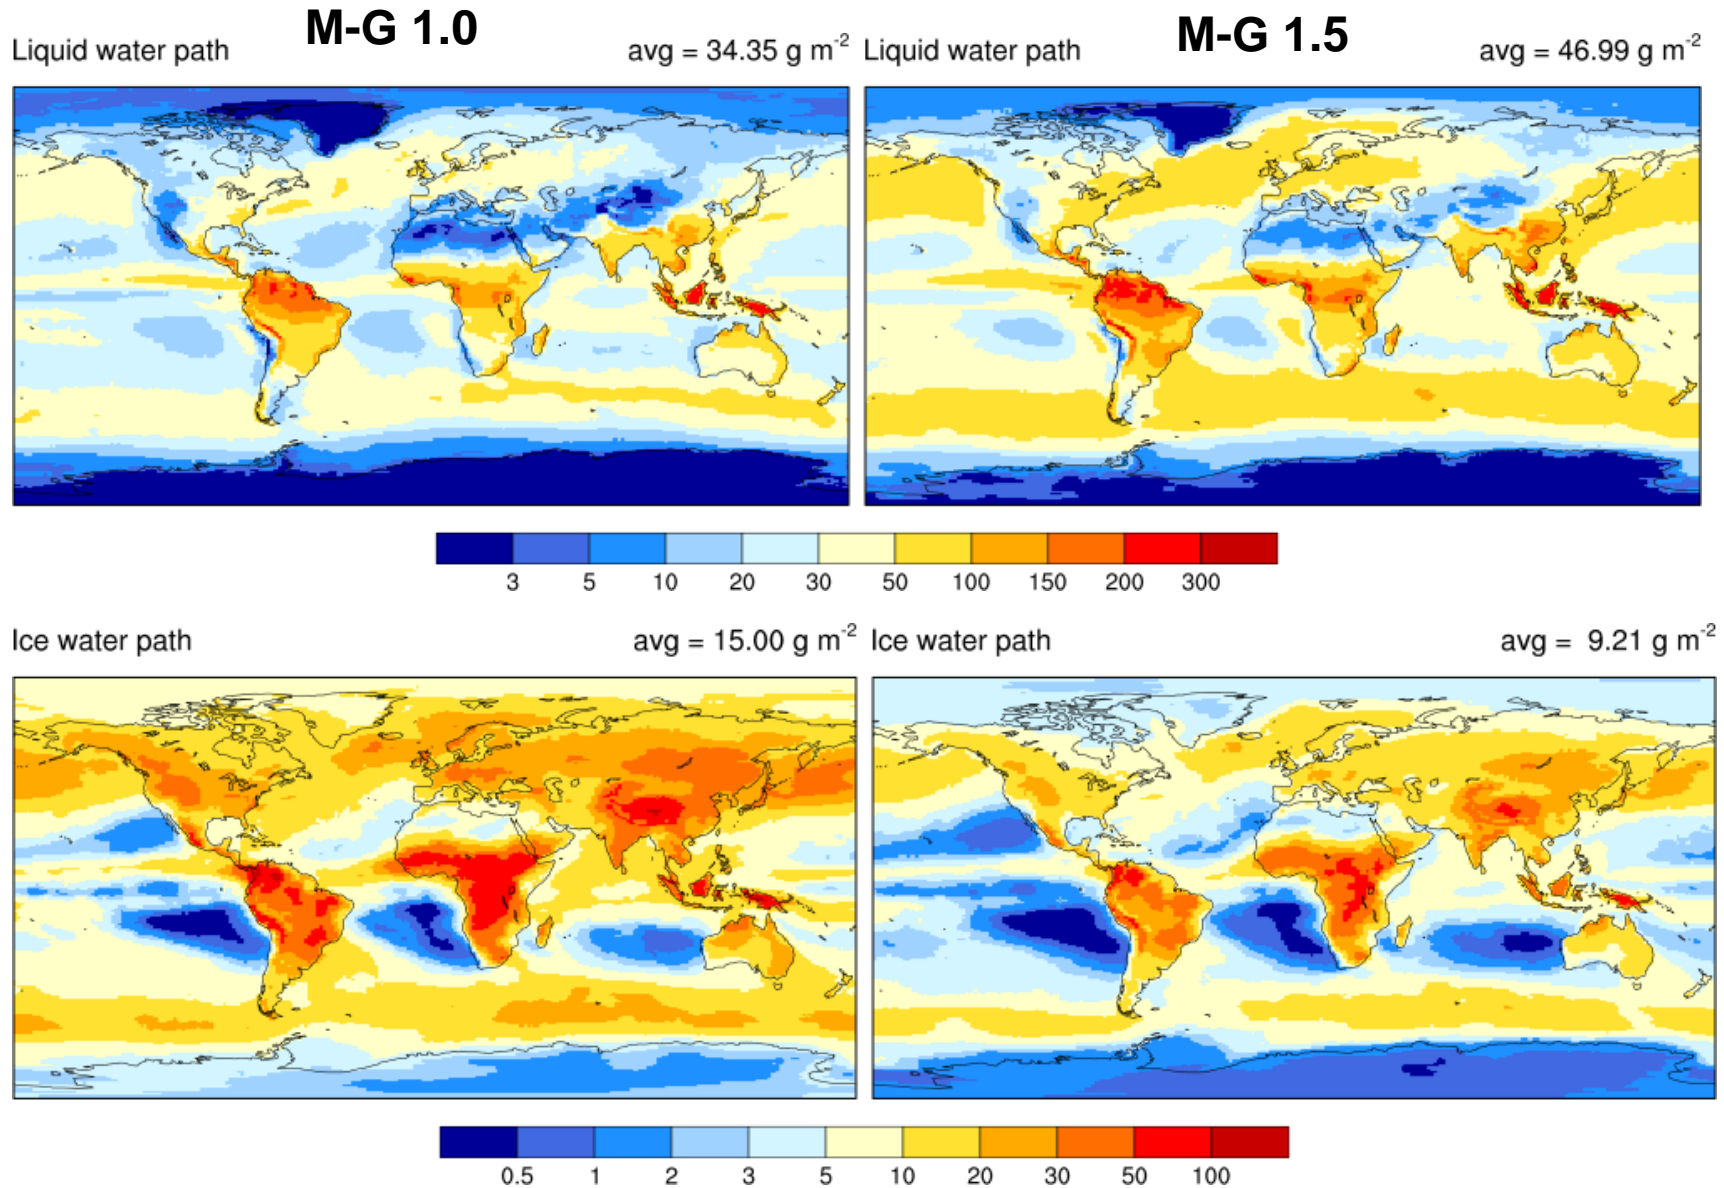

# Different effect of nucleation NH/SH

Difference in nucleation-rate PD – PI in REF-simulation. Increased nucleation in NH (due to larger SO<sub>2</sub> I guess), but decreased nucleation over the areas where there are mostly sea-salt. (Due to more polluted atmosphere in PD acting as “condensation sink for H<sub>2</sub>SO<sub>4</sub>(g) )

# Cloud water and ice

Free-running model has 10 % higher LWP than the nudged version

# Cloud-fraction

**M-G 1.0**

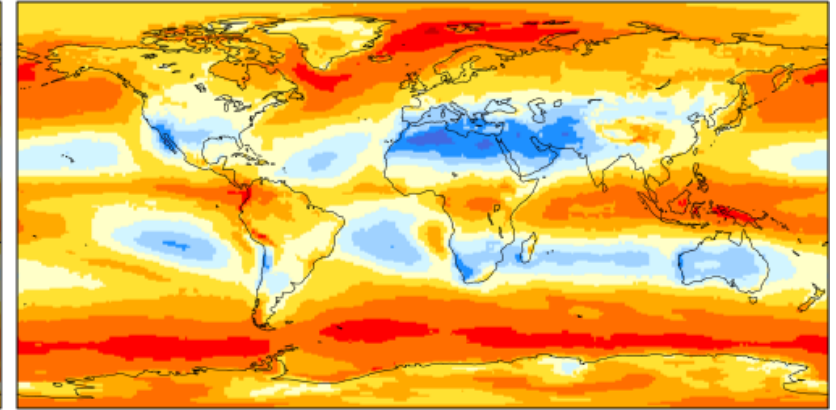

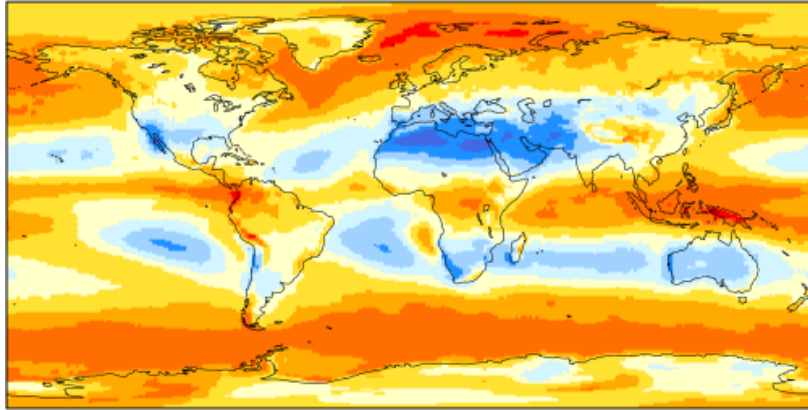

**M-G 1.5**

CLDTOT

avg = 0.62

CLDTOT

CLDLOW

avg = 0.38

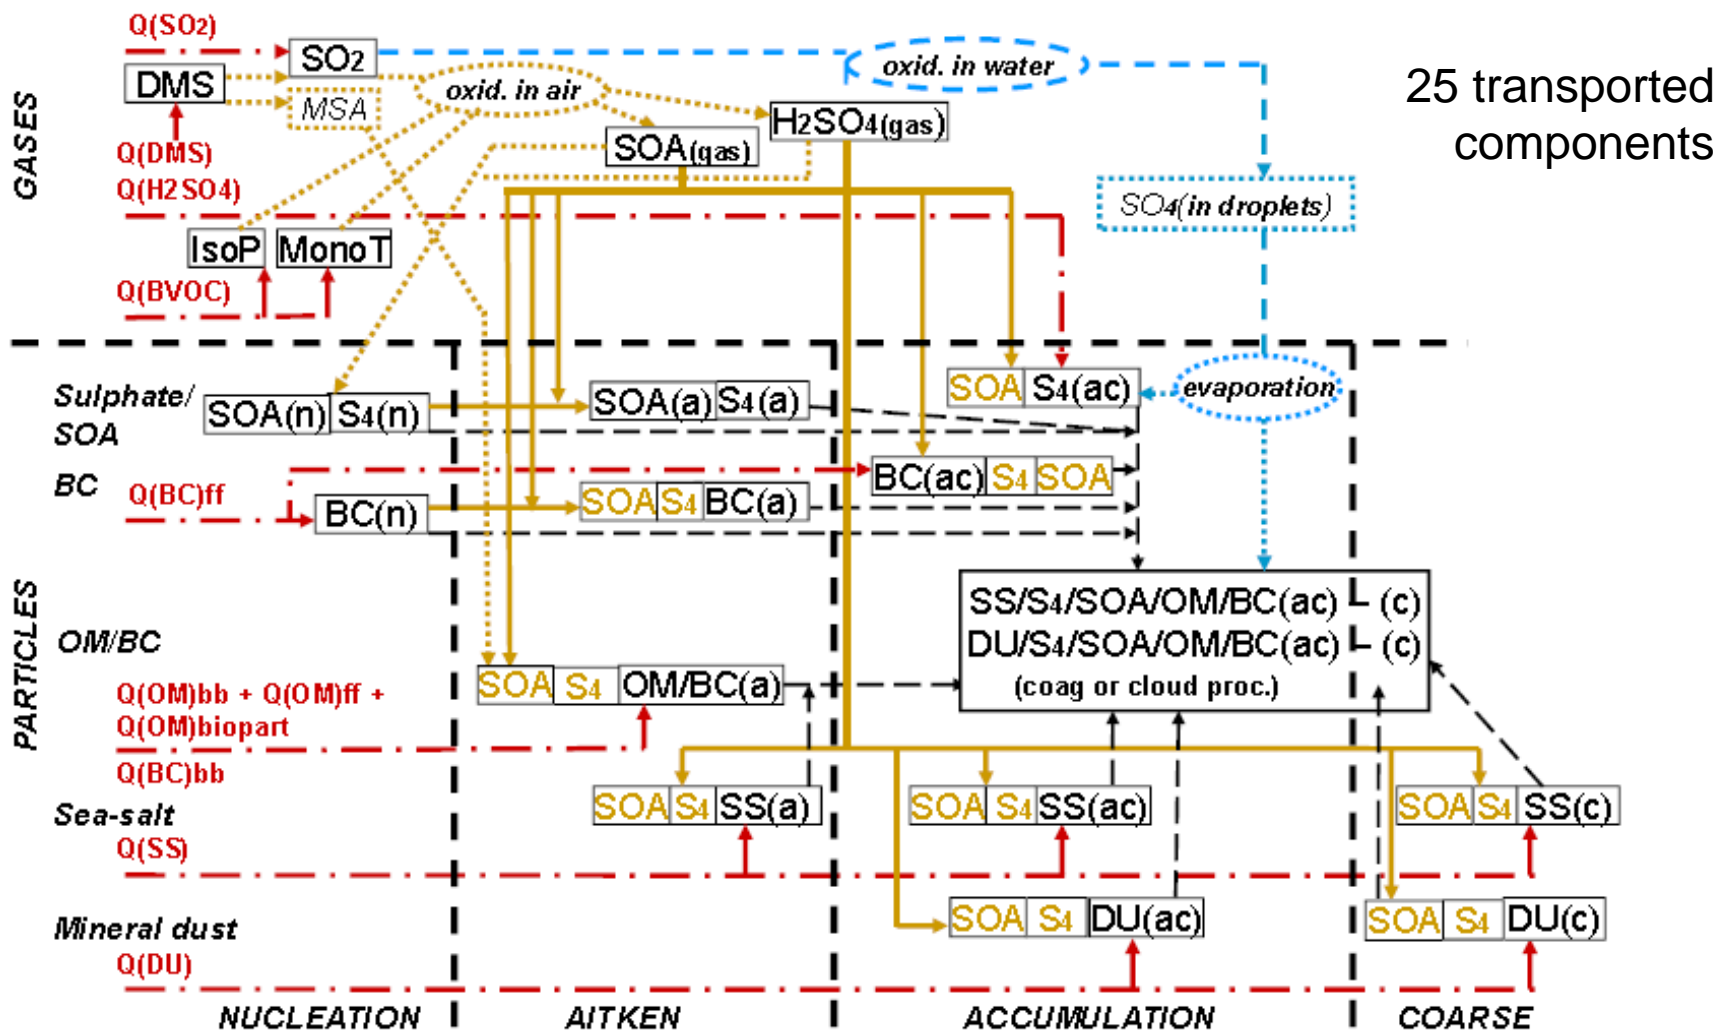

CLDLOW

avg = 0.41

# Complex aerosol-scheme extended since NorESM1 (CMIP5):

- Improved treatment of SOA/SO<sub>4</sub> nucleation and condensation.
- BVOC-->SOA explicit.
- Interactive marine DMS, bio-particles, sea-salt, and dust.
- Explicit concentrations in cloud droplets.

# CAM5.3-Oslo

with nudging towards CAM5.3-AMIP U,V,T-fields

6 year simulations PD and PI, 2 final years used for statistics.

- M-G 1.0

NorESM2-version 18.  
January 2016

- M-G 1.5

Morrison-Gettelmann 1.5 is  
used instead of MG
