Turner et al. (2012)

Carl Mart

Pre-Satellite observations.

Whaling records:

- Show a 2.8° southward shift in ice edge latitude between 1930s and 1970/80s (de la Mare, 1997 & 2009).
- Controversial due to assumptions made about the position of whale catch to ice edge (e.g. Ackley et al., 2003).

Direct observations from ship logbooks:

 Less abundant, but also less open to interpretation

The second second

Expeditions digitised by ICOADS or us.

Voyage of the Scotia (Scottish expedition of 1902-1903)

Scott's Terra Nova Expedition (1910-1913)

Difficulties in satellite vs. ship ice edge observations

The ship observed sea ice edge is on average 0.75±0.61° north of PM Bootstrap ice edge (Worby and Comiso, 2004)

Have things changed?

and the state

Comparison to HadISST

Tentative Conclusions

 We've gathered over 100 ice edge data points from ships logbooks from the Heroic Age of Exploration (1900-1917) from ICOADS or Primary source (actual logbooks).

- The change in sea ice cover is small (Δ~0.6°), only identifiable difference is in the Weddel Sea (where ΔlceEdge~1.9°).
- Useful pinning point for constraining GCMs/Sea ice proxy's.
