

CESM2 PCWG Update

David Bailey and Marika Holland

National Center for Atmospheric Research (NCAR)

Jennifer Kay, University of Colorado

Nicole Jeffery, Los Alamos National Laboratory

Sea Ice Component

- CESM2 will contain version 5.1.2 of the Los Alamos Sea Ice Model (CICE).
- New physics including the mushy-layer physics of Turner and Hunke 2015.
- Level ice melt pond scheme of Hunke et al. 2013.
- The vertical levels in the sea ice have been increased from 4 to 8 and in the snow from 1 to 3.
- We have also moved to a salinity dependent freezing point of Assur, 1958.

Land Component

CLM4 → CLM4.5

- Vertically-resolved soil carbon and nitrogen model --> permafrost carbon
- Cold region soil hydrology updates
- Methane emissions
- Revised snow cover fraction parameterization reflecting hysteresis between accumulation and melt phases
- Improved treatment of snow-covered versus snow-free energy budget
- Surface water store and prognostic wetlands

CLM4.5 → CLM5

- Snow density parameterization updated to include wind impacts and better temperature --> denser and more realistic snow densities
- Max snow depth 10m SWE, up to 10 snow layers --> firn model for ice sheets
- Increased vertical soil resolution --> resolve permafrost active layer thickness
- Snow on vegetation --> improved snow albedo feedback
- Revised plant functional type distributions (shrub fraction reduced)
- Vegetation processes completely revamped, especially plant-nitrogen interactions

Atmosphere Component

- A new parameterization has been introduced (CLUBB) to unify the moist turbulence in CAM6: boundary layer, large scale condensation (cloud fraction) and shallow convection are handled by CLUBB. CLUBB does not operate or close it's equations on ice, only liquid
- The 2-moment microphysics in CAM6 now includes rain and snow as prognostic species. That means snow and rain need not hit the ground in a single time step, and are advected.
- A new parameterization for ice nucleation in the mixed phase regime ($-30 > T > 0^{\circ}\text{C}$) has been introduced that links to aerosols (the old scheme was a function of temperature). This tends to reduce ice nucleation in this regime, and result in more supercooled liquid.

Ocean Component

Estuary box model

- Premixes river water with surrounding ocean using local salinity, temperature, etc. No longer uses reference salinity.
- Resulting water spread vertically in a single grid cell.
- Does not impact frozen runoff.

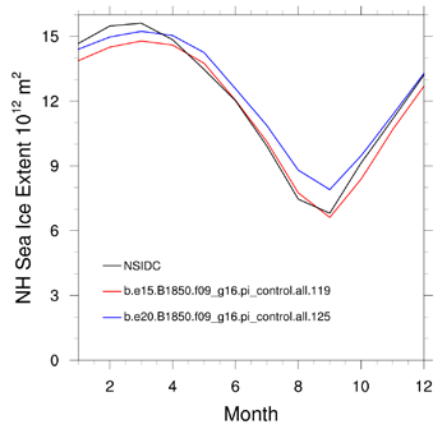

Land Ice Component

- Two-way coupling
- Parallel, higher-order
- TG compset for running standalone CISM
- 10 m snow pack in CLM
- All land/atmosphere resolutions supported
- Surface Mass Balance computed in all runs standard

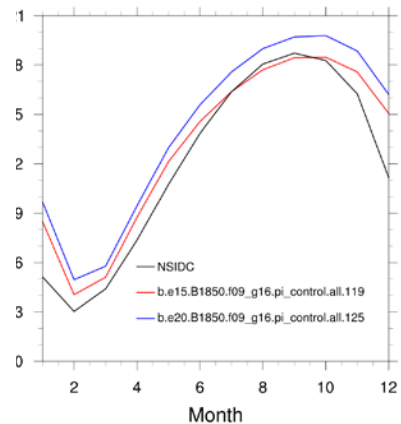

CESM2 Development Runs

CESM Tutorial

There is also an annual CESM tutorial held in July/August and pieces of this are focused on the sea ice component.

Targeted at 2-3 year graduate students.

The next one is August 14-18, 2017 at the NCAR Mesa Lab in Boulder.

The course materials (lectures and exercises) are also available online at:
