

Regional, seasonal and lagged influences of the Amundsen Sea Low on Antarctic Sea Ice

Laura Landrum¹, Marika Holland¹, and Marilyn Raphael²

¹National Center for Atmospheric Research (NCAR), Boulder, CO

²University of California Los Angeles, Los Angeles, CA

Background: Amundsen Sea Low

1979-2015 climatology

ERA-Interim (PSL)
SSM/I (sea ice)

ASL:

Climatological low pressure region in high latitude South Pacific

(60°-75°S, 170°-290°E)

Significantly correlated with:

Southern Annular Mode (SAM)

(all seasons although not as strongly in austral winter)

Nino3.4 (DJF)

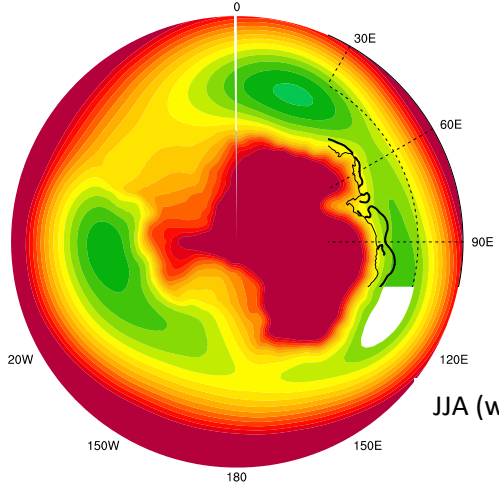

Related to location of maximum cyclone system density in Amundsen-Bellingshausen seas

Tremendous year to year variability

e.g. Fogt et al., JGR, 2012; Hosking et al., J. Clim, 2013

Background: ASL and sea ice extent seasonality

DJF (summer)

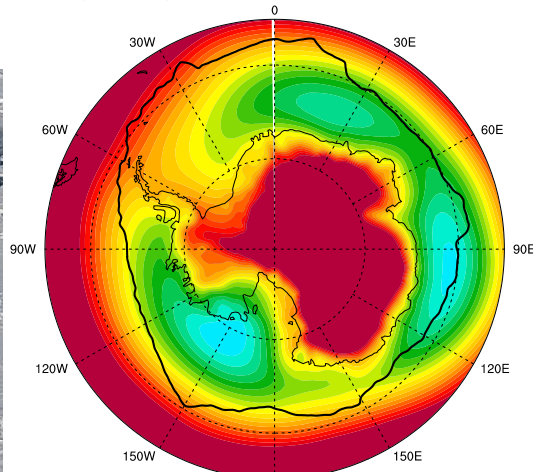

ERA-Interim
1979-2015
climatology

15% ice contour
(black)
SSM/I 1979-2015

MAM (fall)

JJA (winter)

SON (spring)

**ASL metric:
lowest absolute central pressure in
ASL region**

Tremendous year to year variability (depth and location)

ASL: interannual variability

April PSL, winds: climatology

Regression on ASL

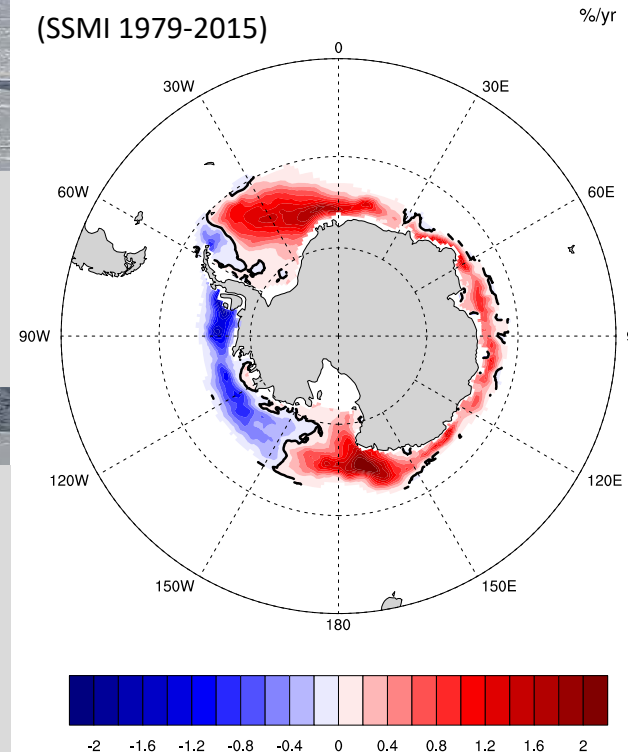

April (example)

ASL impacts Sea Ice through winds

Largest observed SIC trends in region of ASL influence

April SIC trends

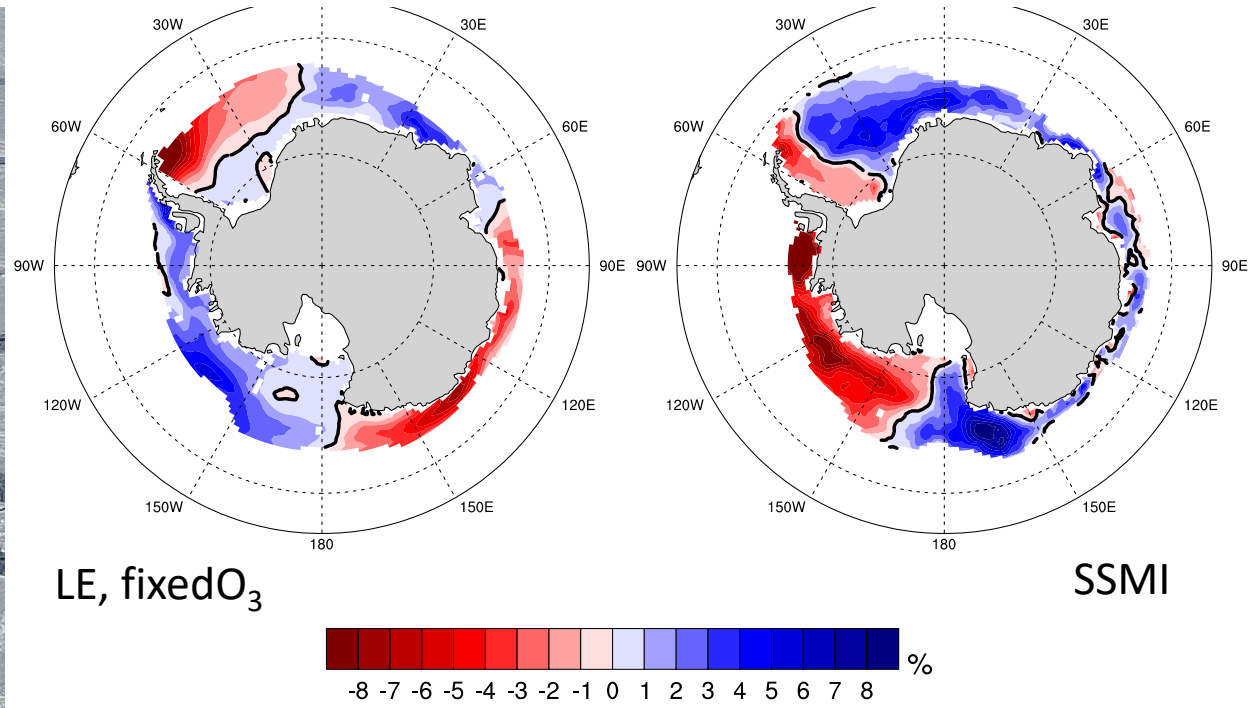

(SSM/I 1979-2015)

Background motivation: ozone, ASL and sea ice

ASL attributed SIC changes, 1955-2005

Observed SIC changes, 1979-2015

DJF ASL deepening over ozone depletion time period (1955-2015)

Deepening summertime ASL does not explain observed MAM sea ice trends

Mechanisms explaining observed fall (MAM) trends in sea ice remain uncertain

e.g. England et al., GRL, 2016; Landrum et al., GRL, 2017

ASL-Sea Ice Concentration

An aerial photograph of a vast, flat expanse of sea ice. The ice is a light greyish-blue color, with numerous dark, winding cracks and ridges crisscrossing the surface. The horizon is visible in the distance under a clear, pale blue sky.

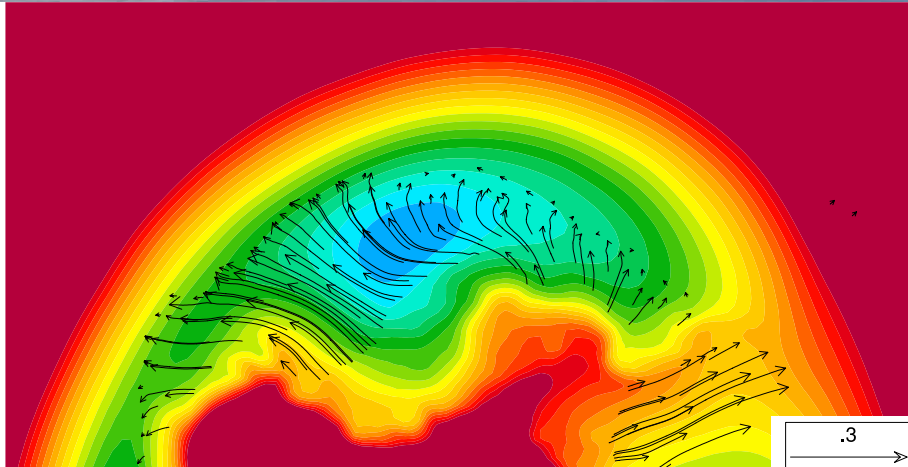

3 examples of ASL influence on SIC

1. April (sea ice advance)

2. July (mid-winter)

3. October (sea ice retreat)

April ASL

Mean SLP, ice motion

989 990 991 992 993 994 995 996

R:ASL-SLP, ice motion

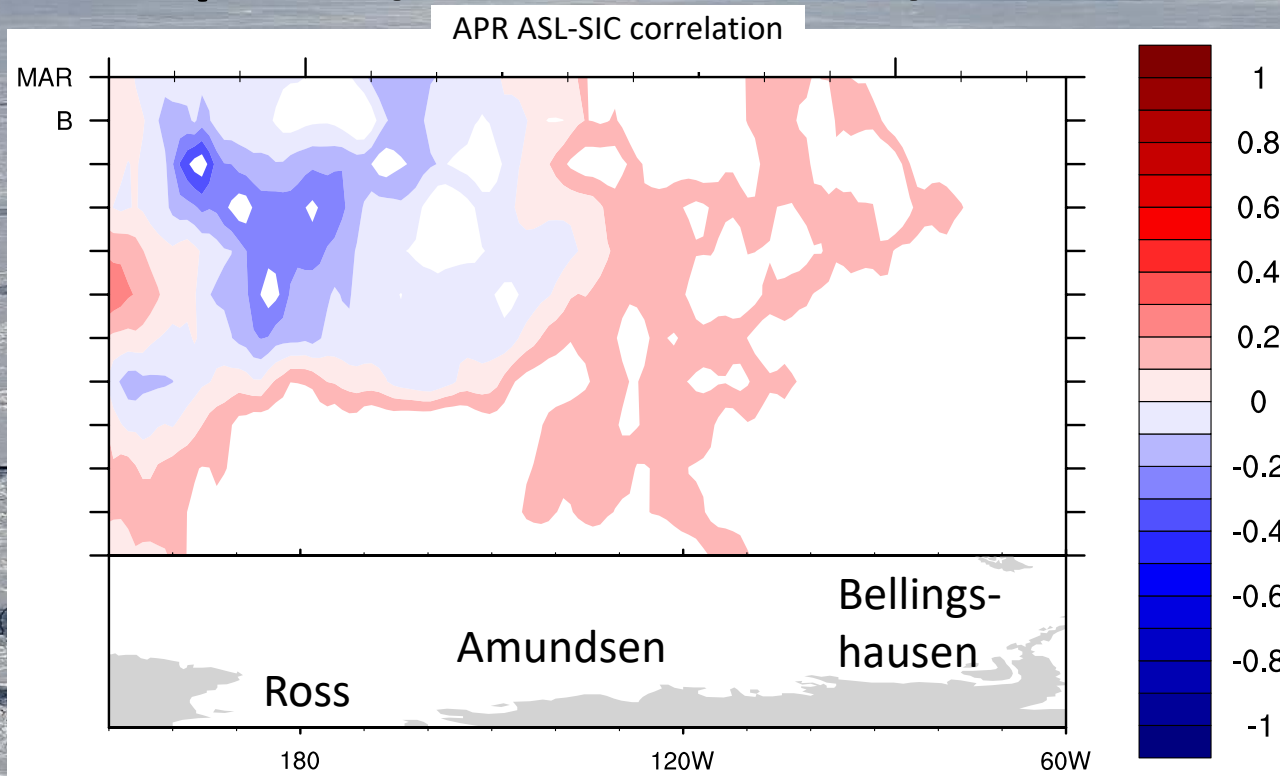

8 -7.2 -6.4 -5.6 -4.8 -4 -3.2 -2.4 -1.6 -0.8 0 0.8 1.6

Deepening ASL:
↑ SIC in Ross,
Amundsen

April ASL - April SIC correlation

April (austral fall) ASL

- Deepening ASL → increased SIC in Ross, Amundsen
- Anomaly increases then persists (1 – 3 months)

- Ice advancing
- Ice edge close to ASL lat
- Mean ice motion: meridional (V) > zonal (U)
- ASL impacts primarily meridional ice motion

July ASL

Mean SLP, ice motion

977 978 979 980 981 982 983 984 985 986 987 988 989 990 991 992 993 994 995 996

R:ASL-SLP, ice motion

Deepening ASL:

↓ SIC in Ross (outer),
Bellingshausen

↑ SIC in Amundsen

July ASL - July SIC correlation

July (austral winter) ASL

- Deepening ASL → tripole anomaly pattern:
 - decreased SIC in Ross, Bellingshausen
 - increased SIC in Amundsen
- Anomaly grows (1-3 months) and persists (~7 months in Ross-Amundsen)

- Ice nearing maximum
- ASL within ice pack
- Mean ice motion: meridional (V) ~ zonal (U)
- ASL impacts primarily zonal ice motion (U)

October ASL

Mean SLP, ice motion

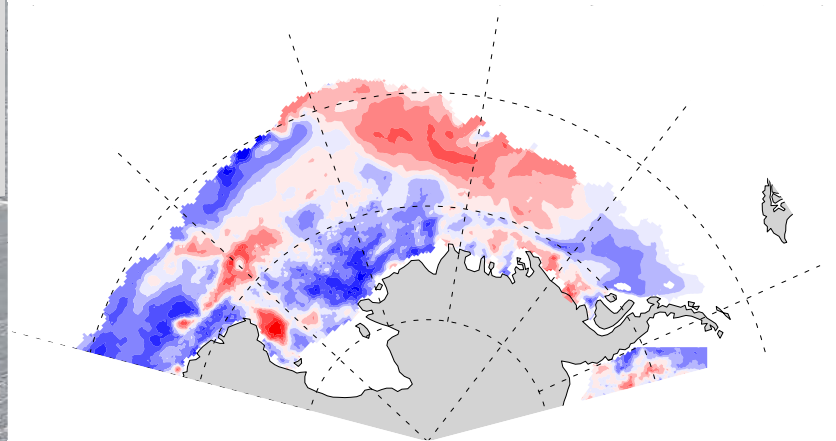

77 978 979 980 981 982 983 984 985 986 987 988 989 990 991 992 993 994 995 996

R:ASL-SLP, ice motion

Oct ASL - Oct SIC correlation

Deepening ASL:
Relatively little lag-0 influence

October ASL

October

November

December

January

February

March

2 different processes:
Zonal ice motion (outer Ross) – similar to July

Seasonal ice retreat (inner Ross) opposite to July

Ice thinning

Earlier melt out

Higher solar radiation

Warmer ssts

delayed ice advance 5 months later

(Holland et al., Nature Communications, 2017)

MAR ASL: MAR SIC

October (austral spring) ASL

- Deepening ASL → decreased SIC in Ross, Bellingshausen, increased SIC in Amundsen
- ASL influence on ice motion similar to July
- Oct ice retreating (unlike July)
- Lagged relationships stronger than coincident relationships

- Ice retreating (Ross Sea no longer producing ice)
- ASL within ice pack
- Mean ice motion: meridional (V) ~ zonal (U)
- ASL impacts primarily zonal ice motion (U)
- ASL also increases ice transport out of inner Ross Sea (U and V), thinning the ice pack (initially little impact on sea ice concentration)

Summary

April ASL

Meridional ice motion

Anomaly persists ~3 months

July ASL

Zonal ice motion

Very persistent anomalies (7+ months)

Oct ASL

Zonal ice motion

Thinning of ice in inner Ross sea

Earlier melt out

Highest correlations at 5 months lag

Oct ASL: Mar SIC relationships stronger than Mar ASL: Mar SIC

Summary

“Generally accepted” view
deepening ASL (\downarrow PSL)
leads to:
 \uparrow SIC Ross (western flank)
 \downarrow SIC Bellingshausen
(eastern flank)

Sometimes right, sometimes wrong

it's complicated

(ice motion: mean and ASL influence; location of ice edge & ASL, ice retreating vs. advancing)
