# Contents

## 1. Background

### 1.1 The End-Permian Mass Extinction Event

Possible triggers and consequences

## 2. Objectives

## 3. Methodology

### 3.1 Climate modeling: model description and boundary conditions

### 3.2 Phyto-geographical analysis

## 4. Results

### 4.1 Model simulations

### 4.2 Phyto-geographical analysis using fossil data

### 4.3 Correspondence analysis

## 5. Conclusion

## 6. Current Work and Future Outlook

---

# 1.1 The End Permian Mass Extinction Event

Payne and Clapham, 2012

The End Permian Mass Extinction (EPME) occurred ~251.9 Ma (Shen et al., 2006)

Around 90% of marine and 70% of terrestrial species went extinct - also referred as “*The Great Dying Event*” (Erwin, 1990)

## 2. Objectives

- How did the seasonality change across the PTB?
- How did phyto-geographic patterns change due to changes in seasonality caused by aerosol and CO<sub>2</sub> radiative forcing?
- How much radiative forcing is required to simulate a climate consistent with the reconstructed biogeographic patterns?

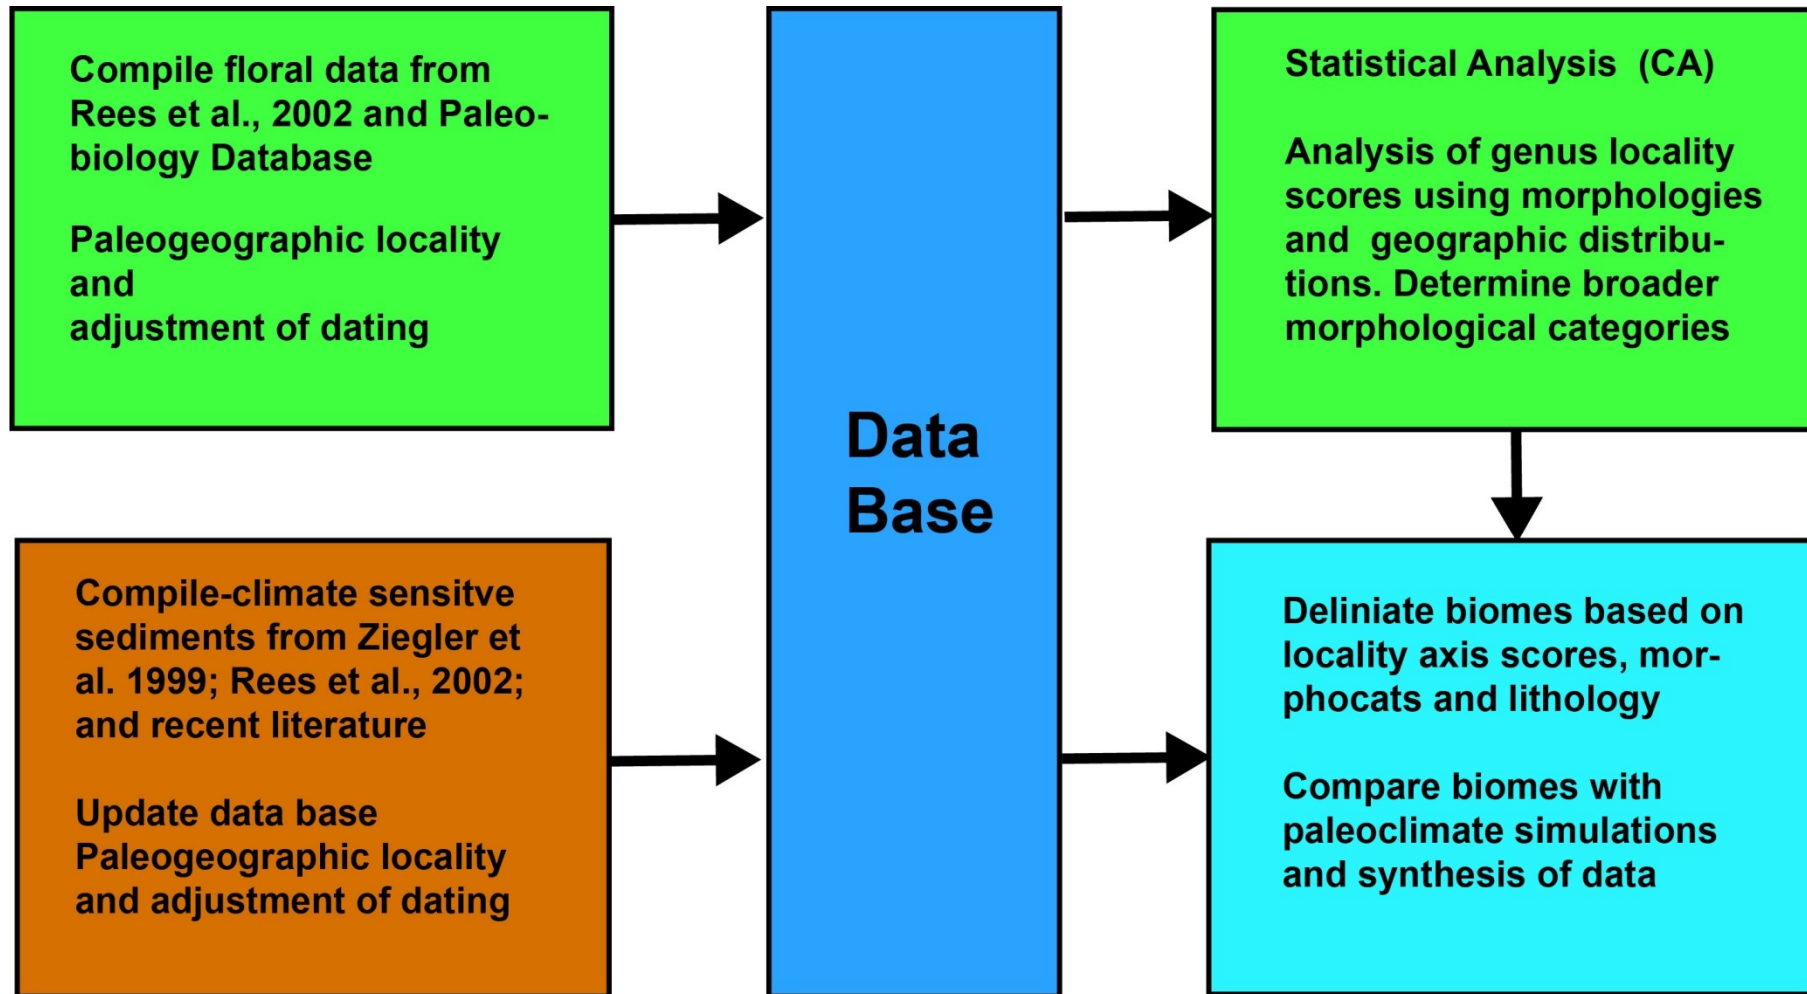

## 3.1 Model Description and Boundary Conditions for CCSM3

- A fully coupled comprehensive model, the Community Climate System Model (CCSM3; Collins et al., 2005), is applied for the climate sensitivity experiments.

### Boundary Conditions

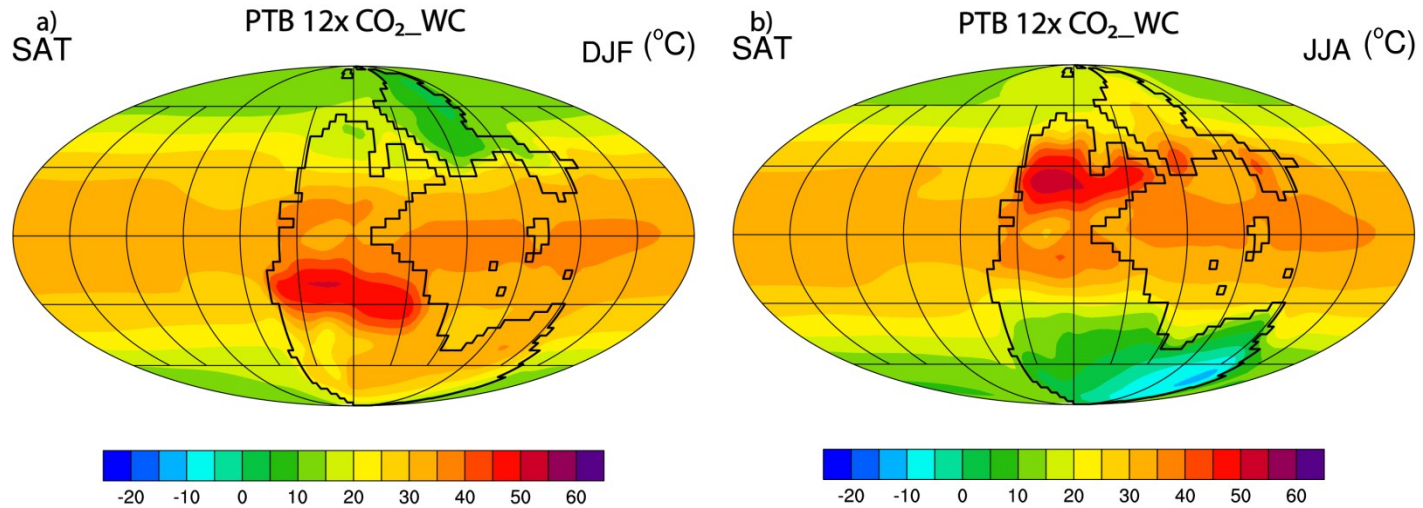

- Intensity of solar radiation: 2.1% reduced compared to present day (Caldeira and Kasting, 1992),  $S = 1338 \text{ W m}^{-2}$
  - Greenhouse gas concentrations (Kiehl and Shields, 2005)
    - CO<sub>2</sub>: 3550 ppmv
    - CH<sub>4</sub>: 0.7 ppmv
    - N<sub>2</sub>O: 0.275 ppmv
  - Orbital cycles: Eccentricity 0°, Obliquity 23.5°
  - Vegetation cover following Rees et al., 1999
  - Topography: Paleogeographic Atlas Project
-

## 3.2 Phytogeographical Analysis

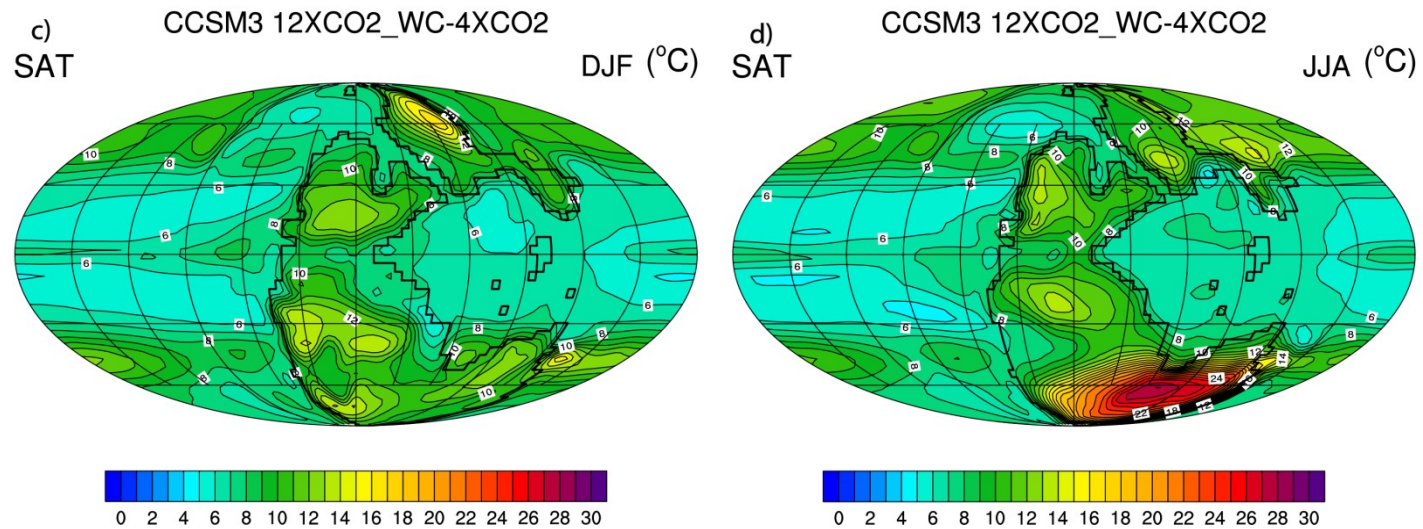

# 4.1 CCSM 3 Climate Model Simulations

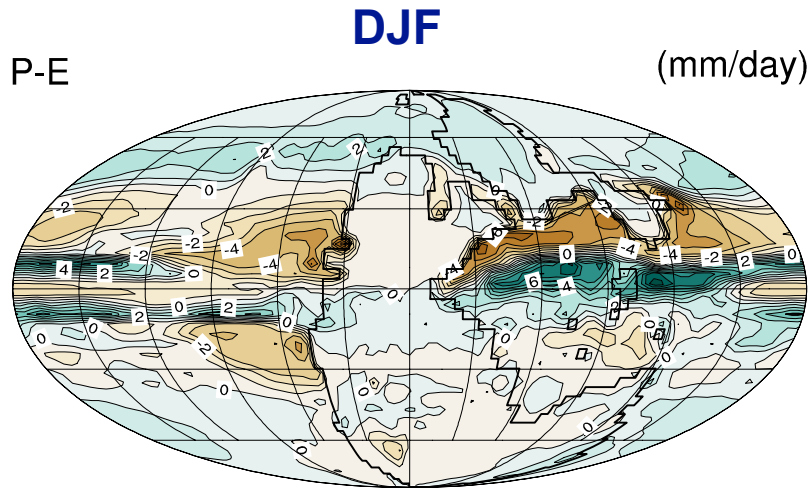

12.7x CO<sub>2</sub>  
Warm  
Climate  
SAT for  
DJF (a)  
and JJA (b)

12.7x  
CO<sub>2</sub>\_WC -  
4x CO<sub>2</sub>  
SAT for  
DJF (c)  
and JJA (d)

4x CO<sub>2</sub>

12.7x CO<sub>2</sub>  
Warm  
Climate

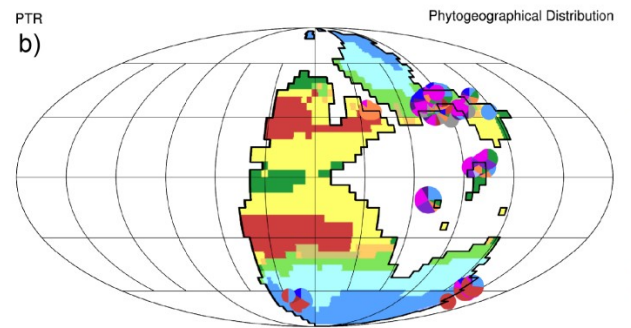

# 4.2 Phyto-geographical Distribution and CCSM3 simulations

- Conifer
- Cordaite
- Cycadophyte
- Dicranophyllum
- Fern
- Fern 3
- Gigantopterid
- Ginkgophyte
- Glossopterid
- Lycopsid
- Peltasperm
- Pinales
- Pteridosperm
- Sphenopsid

Morphological Categories

- Polar
- Tundra
- Cold temperate
- Temp. Desert
- Cool Temperate
- Warm Temperate
- Winter Wet
- Desert
- Summer Wet
- Trop. Wet
- Water

Simulated Biomes

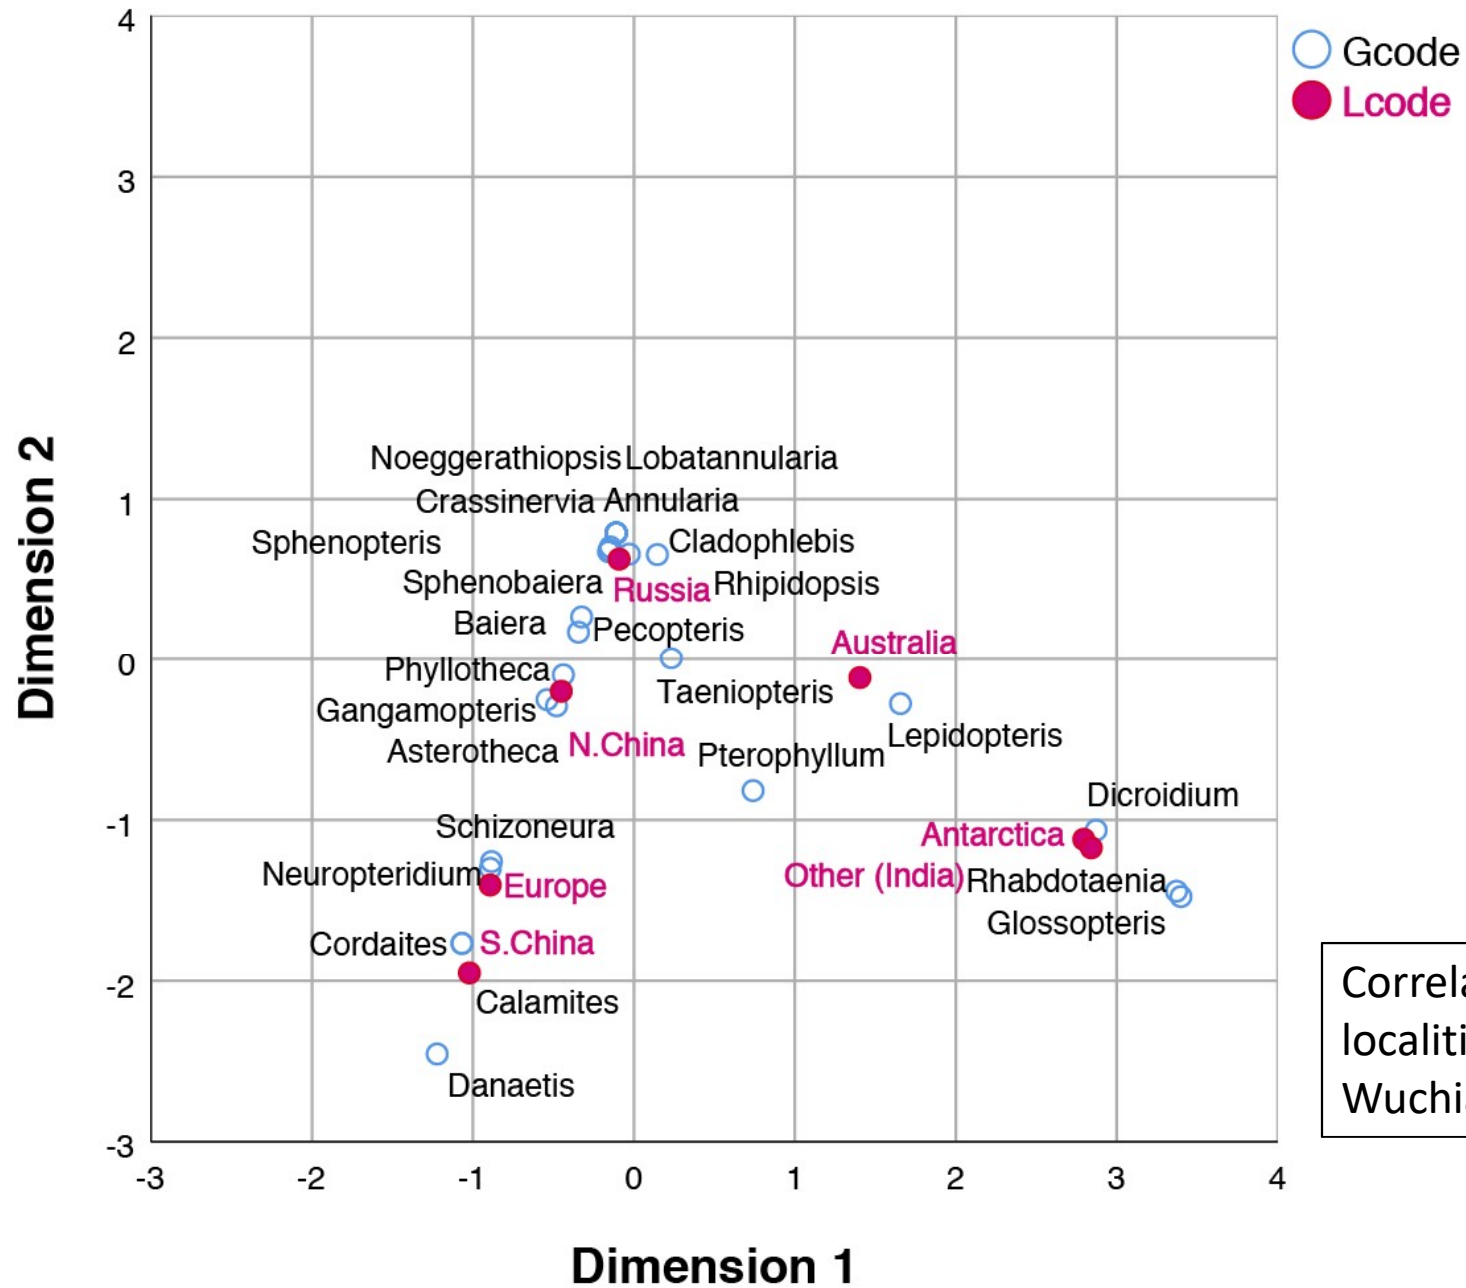

- 1-2
- 3-5
- >6

Number of Genera

Phytogeographic distribution during Wuchiapingian (a), Changhsingian (b) and Early Triassic (c) derived using plant-fossil data. The pie-charts are overlain on the biomes simulated from CCSM3 for 4x CO<sub>2</sub> (a), 12.7x CO<sub>2</sub> (b) and 12.7x CO<sub>2</sub>\_WC (c) respectively. The size of the pie-charts represents the diversity of the flora.

## 4.3 Correspondence Analysis (Wuchiapingian Stage)

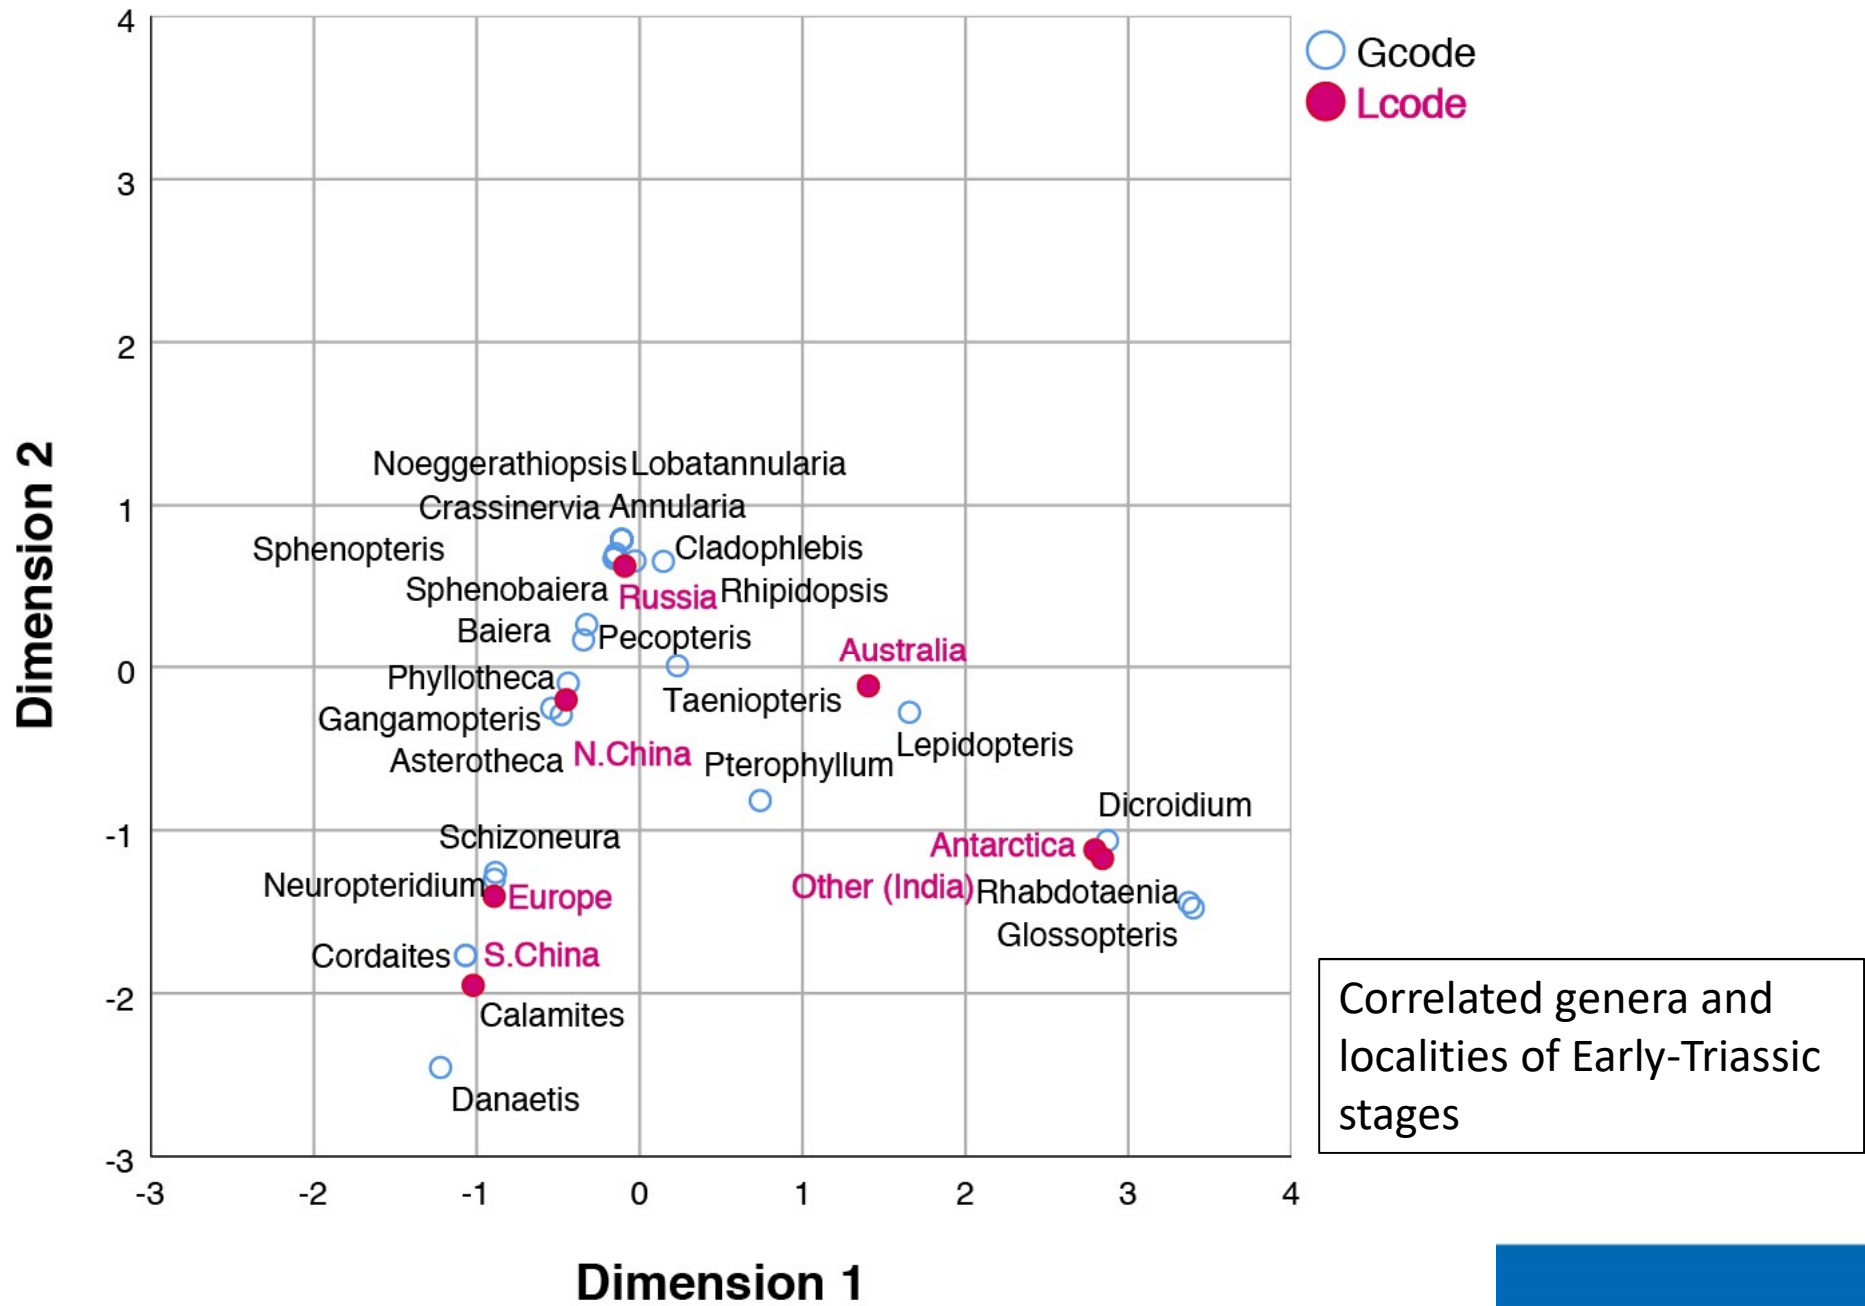

<b>Summary</b>

## 5. Conclusions

- The modeling results show significant seasonality in temperature over the interior of the continents, whereas seasonality of precipitation is much smaller.
- As we moved towards a hothouse climate, there was a significant decline in the diversity. However, it is still not clear whether it was an extinction or an evolutionary succession of tolerant species.
- The multivariate statistical analysis ensures a consistent interpretation of floristic patterns which can be used to compare with or validate climate simulations.

## 6. Current Work and Future Outlook

- Set up paleo boundary conditions CEM 1.2 simulation with FV1.9\_2.5 and nominal 1° ocean .
- Update PTB topography using Torsvik et al.,(2012) reconstruction.
- Update the aerosol forcing for PTB in collaboration with Ben Black.
- Update the land surface parameterization by incorporation of reconstructed biomes based on plant fossil data.
- Solar and orbital forcing will be taken from Kiehl and Shields (2005).
- The CO<sub>2</sub> radiative forcing will be set to 4x PAL and 12x PAL.

# PTB Topography smoothing

Torsvik et al.(2012)

# Acknowledgements

- All the simulations have been carried out using the supercomputing facilities of NCAR.
- The research has been funded by NSF EAR 1636629.
- A special thanks to Angela Osen for downloading the data from the Paleobiological database.
- A special thanks to Dr. John Connolly, Data Scientist from the office of Information and Technology for his expert guidance and help with the statistical analyses using SPSS.

**THANK YOU FOR  
ATTENTION.**
