CESM AMWG Meeting, Feb 11th, 2021

Background & Motivation of studying Asian Summer Monsoon (ASM) using MUSICA

- Largest meteorological pattern in the NH summer season.
- Efficient pathways to transport boundary layer air to the UTLS.
- **Deep convection, large-scale anticyclone and eastward shedding** – proper representation of these processes helps to characterize ASM chemistry-climate interactions.
- Provide Chemical forecast to support Asian Summer Monsoon Chemical and Climate Impact Project (**ACCLIP**) mission objectives – with a focus on **West Pacific region**.

Asian summer monsoon Chemical and Climate Impact Project (ACCLIP)

ACCLIP is designed to provide in-situ measurements necessary for addressing the science questions of ASM chemistry-climate impact.

Chemistry in the ASM outflow

➤ Tracers of transport

- Anthropogenic & Natural sources

➤ Ozone chemistry and budget

- Ozone depletion substances: long-lived and short-lived chlorine and bromine gases
- Ozone precursors: NMHC, OVOC, NO_x (lightning/combustion)

➤ Chemistry-Climate interaction

- Short-lived climate pollutants
- Aerosol precursors and aerosol formation/transport/interaction

Regional Refinement for ASM

CESM2.2 CAM6-chem with 32L (MUSICA V0)

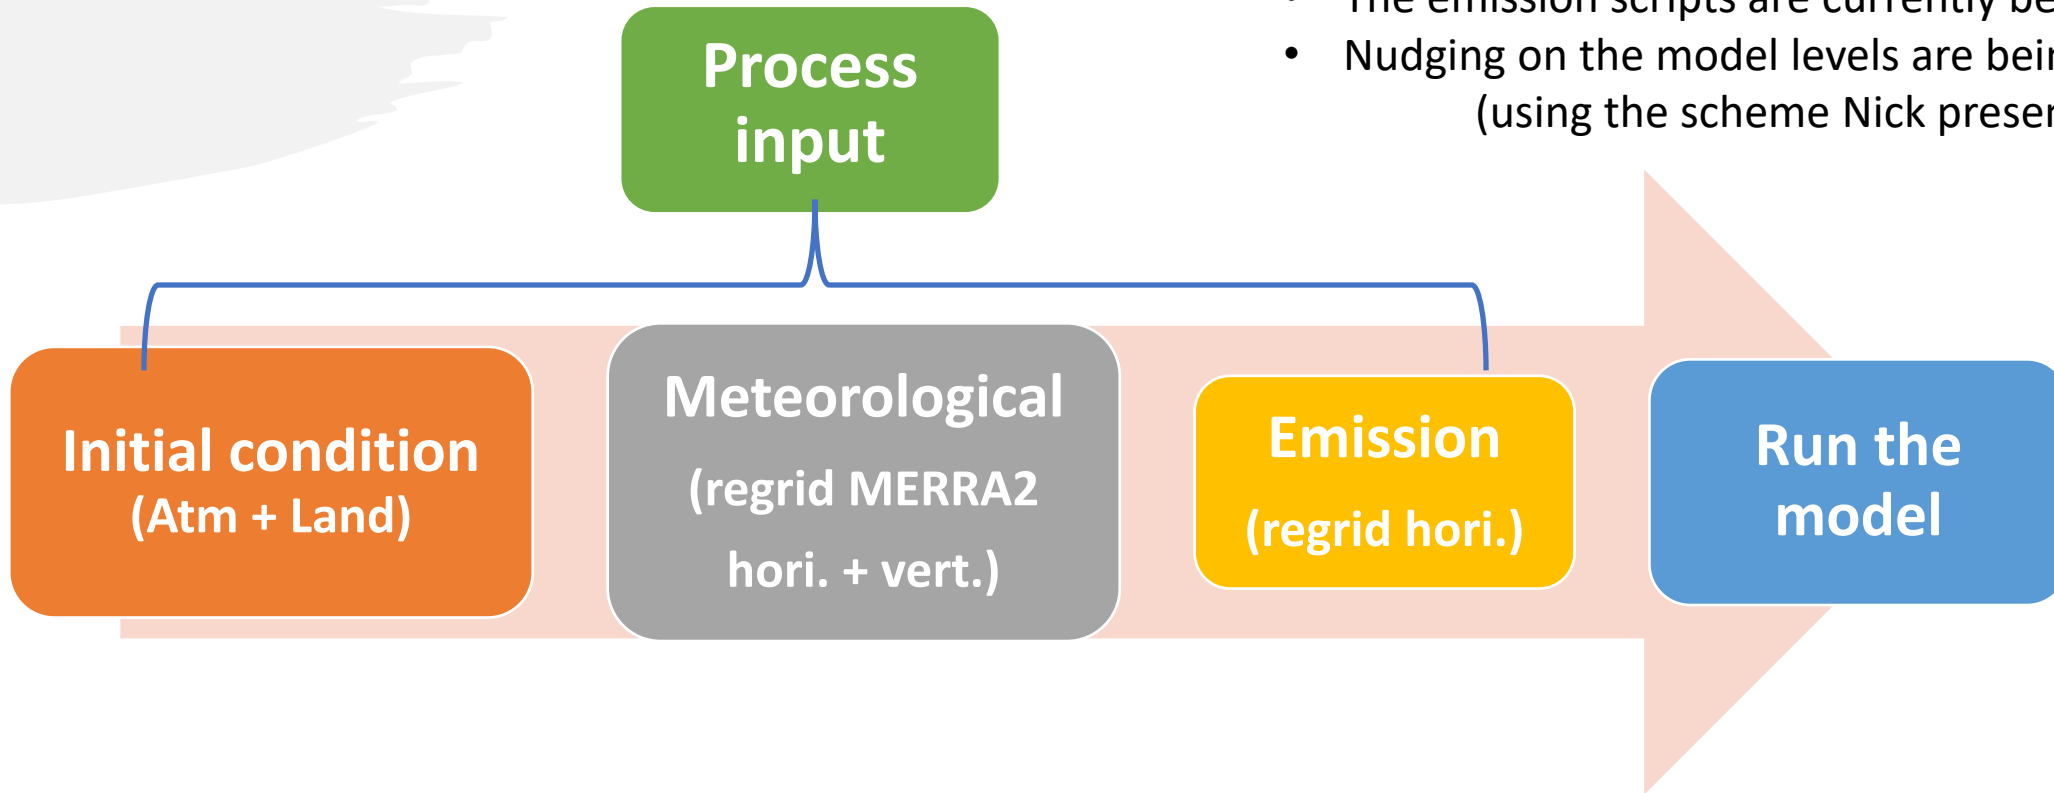

- Cube sphere grid; SE dycore; resolution around 1 degree down to a fine resolution of 0.25 degree.
- Cover the ASM deep convection; anticyclone over the Tibetan Plateau and eastward eddy shedding over the WP region.
- Allows for better representation of regional processes and chemistry of surface emissions.
 - At finer resolution, emissions and chemistry are more accurately represented.
- Include both natural and anthropogenic emission sources from South and East Asia.
 - Pollutants are simulated on human exposure-relevant scales.

Modeling Steps

<https://wiki.ucar.edu/display/MUSICA/MUSICA+version+0>

<https://github.com/NCAR/IPT>

- The emission scripts are currently being updated.
- Nudging on the model levels are being performed (using the scheme Nick presented on Monday).

Atm: spun-up CAMchem run using SE ne30 (1deg)

Land: CAM SE ne30 1deg model to spinup the land initial conditions

2020-07 to 2020-08 to reproduce the dry run period in 2020 for ACCLIP campaign and compare with other model results.

- Model cost: 150k per year

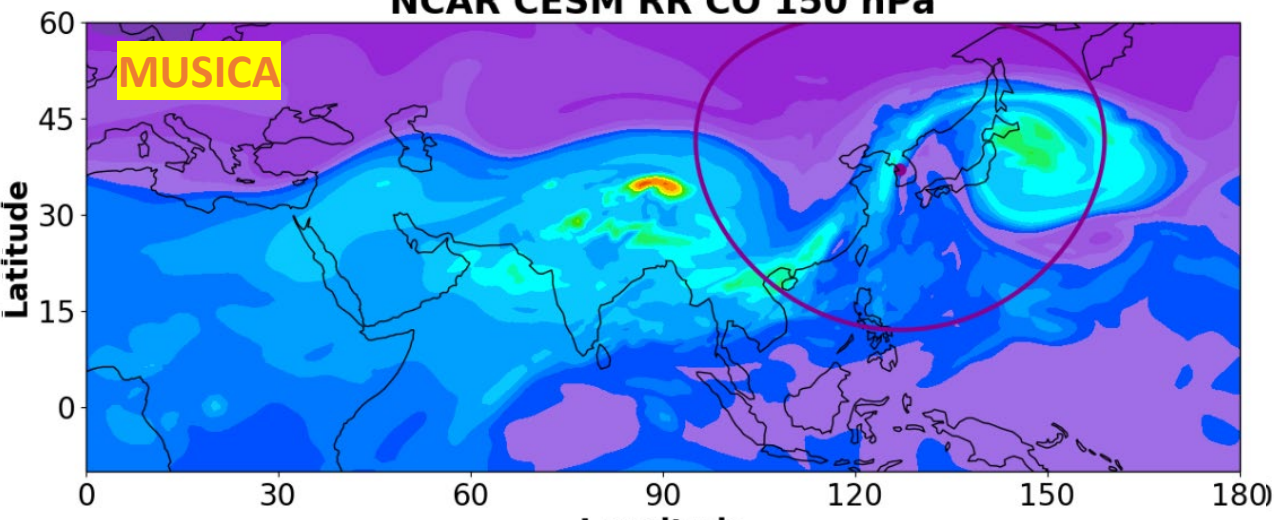

Compare MUSICA to Models used in 2020 dry run period

Model System	Resolution	Chemistry	Aerosol
NCAR CESM2 MUSICA	0.25 to 1 deg, 32L, surf to 45 km ~1km vertical res. in UTLS ~30km horizontal res.	TS1 Interactive chemistry	MAM4 (modal)
NCAR CESM2 WACCM6-SD / GEOS5	1-deg, 88L, surf to 140km ~1km vertical res. in UTLS ~100km horizontal res.	TSMLT Interactive Chemistry 240 species	MAM4 (modal)
NASA GEOS	0.25 deg, 72L, surf to 80 km ~1km vertical res. in UTLS ~30km horizontal res.	Specified Oxidants (OH, H ₂ O ₂ , NO ₃ from GMI)	GOCART (Bulk)

Summary

- Successfully running MUSICA with Asia grid for the first time. 😊
- Regional refined CAM6-chem represents the ASM reasonably well, and agrees well with GEOS5 and satellite observations.
- MUSICA is an important tool to study ASM and its chemistry-climate interaction – to support the chemical forecast for ACCLIP Campaign.

First but very important step!

Next step

Update emissions, this includes new VOC emissions

Produce new spinup simulation with CO tags and produce new run

Incorporate more complete halogen chemistry (e.g., iodine chemistry)

Compare the CAM-chem RR with the CAMchem in 1deg; Test other grids

Eventually prepare the model for the ACCLIP campaign study

Thanks for
your attention.
