

A dramatic sky over the ocean with sunbeams and a bird. The sky is filled with dark, heavy clouds, but a bright light source behind them creates several distinct sunbeams (crepuscular rays) that fan out across the scene. A single bird is seen in flight in the middle ground, positioned between the sunbeams. The bottom of the image shows the dark, textured surface of the ocean.

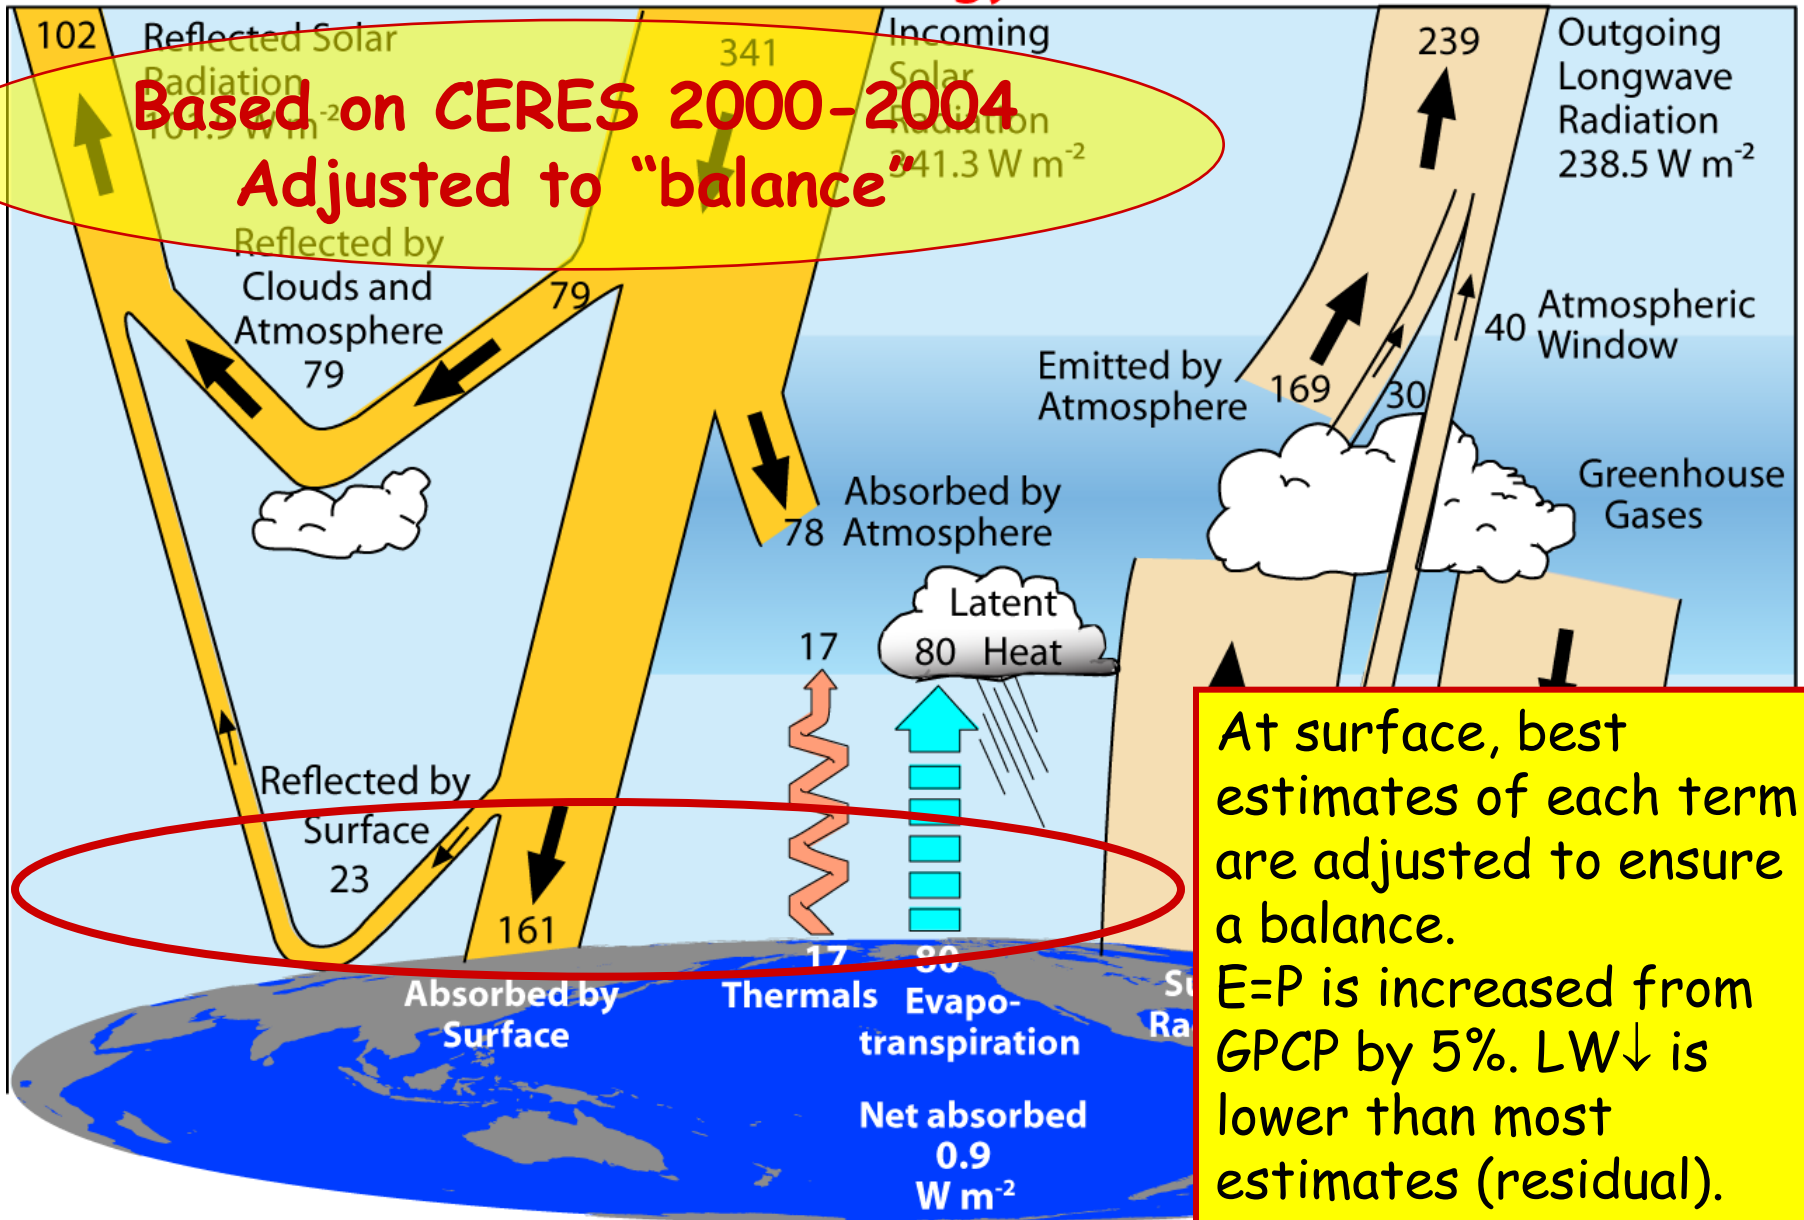

# Simulation of present day and 21<sup>st</sup> century energy budgets of the southern ocean

Kevin E. Trenberth

NCAR

with John Fasullo

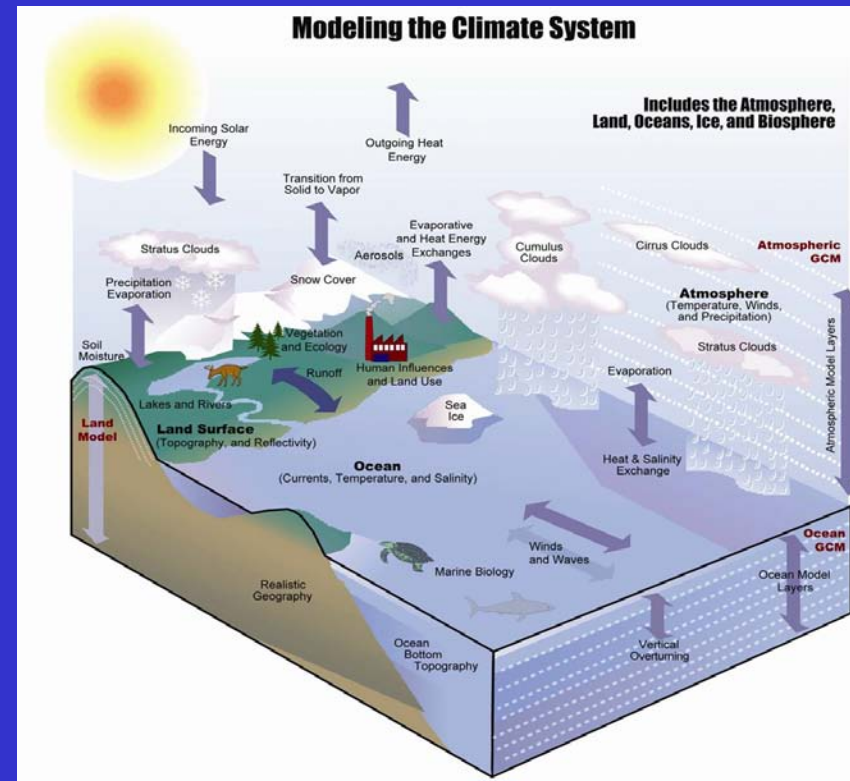

# Global Energy Flows $W m^{-2}$

# Evaluation of models

- Reanalysis models: atmospheric
- CMIP3 AR4 models

- Focus on energy

# Energy budget: Reanalyses

- At TOA, most climate models are tuned to get balance or replicate ERBE/CERES
- Depends on equilibrium simulation
- No longer works in reanalyses
  - Specified SSTs
- Global imbalances (hide even bigger local)

Clouds

ISCCP D2 [1990-1999]

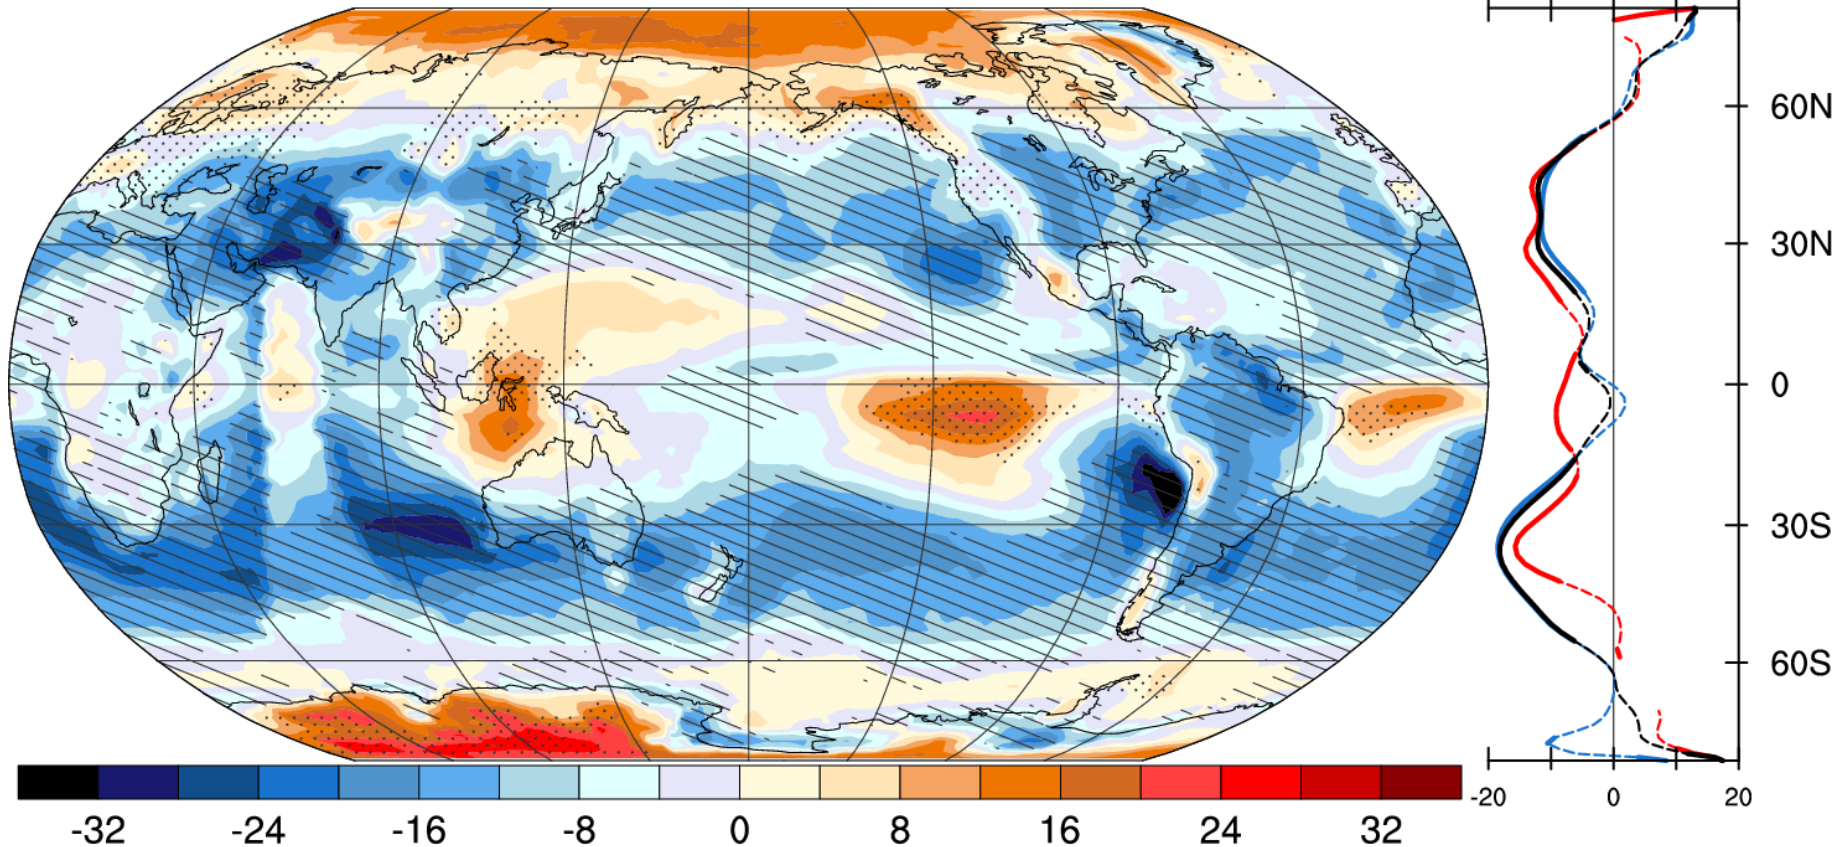

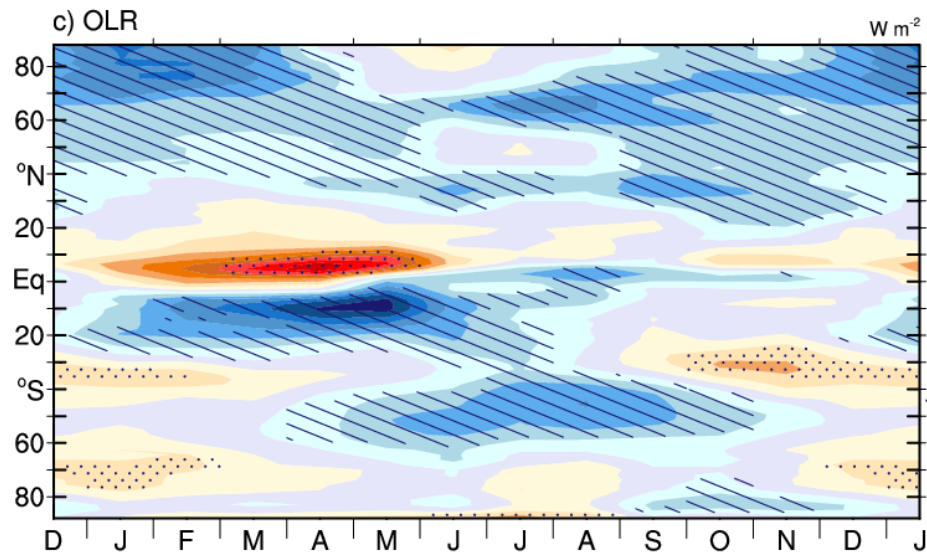

# Cloud biases

Cloud Percent

CMIP3 Mean Bias vs ISCCP D2 1990-1999 [%]

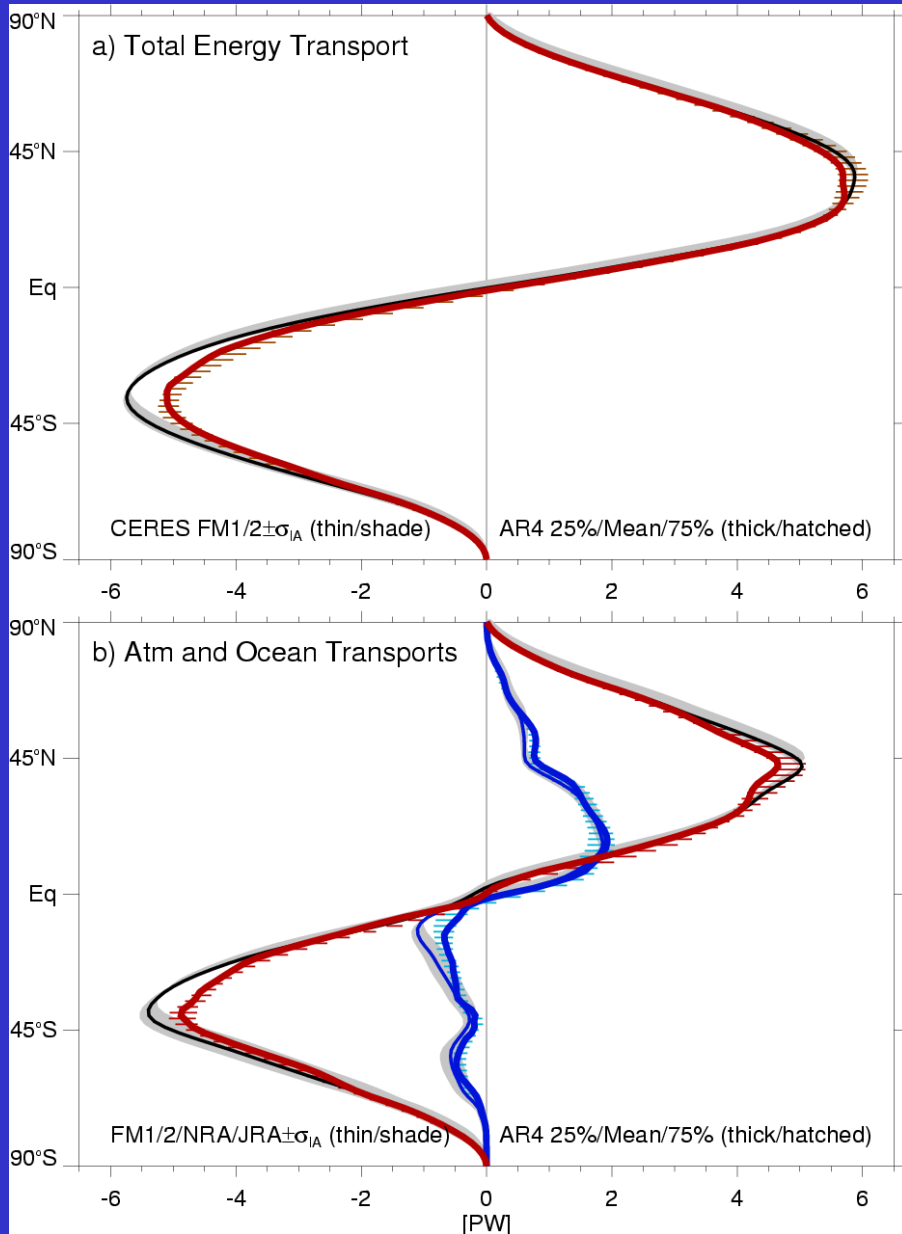

# Annual cycle of biases

Similar errors all year round, but biggest over southern ocean in summer

# CMIP3 model energy transports

Poleward transports too low in many models owing especially to deficient cloud:

e.g. too much solar radiation absorbed in southern oceans.

# Consequences of Southern Hemisphere SW Biases

- All models have too much incoming solar radiation in southern oceans: too much heating of ocean
- And too little in lower latitudes
- True in reanalyses and climate models
- Diminishes ocean and atmospheric poleward heat transports
- Increased annual cycle of ocean temperature / energy content at middle and high-latitudes
- Increased annual cycle of net TOA radiation - projects disproportionately on SH summer

# Climate sensitivity

# Trends in Southern Hemisphere clouds and radiation

- ☉ Clouds mostly decrease in low-mid latitudes
- ☉ Clouds increase in polar areas where sea ice decreases
- ☉ These increases extend over southern oceans
- ☉ The increases relate to more cyclonic conditions (lower SLP) and poleward shift in storm tracks
- ☉ Such increases in cloud are unlikely, and can only occur because of the low bias in the model climatology
