MIT JOINT PROGRAM ON THE
SCIENCE AND POLICY
of **GLOBAL CHANGE**

Overview

Research Questions:

What is the impact of the choice of chemical mechanism, model, meteorology, and resolution on surface chemistry (i.e. O₃ and PM_{2.5} biases)?

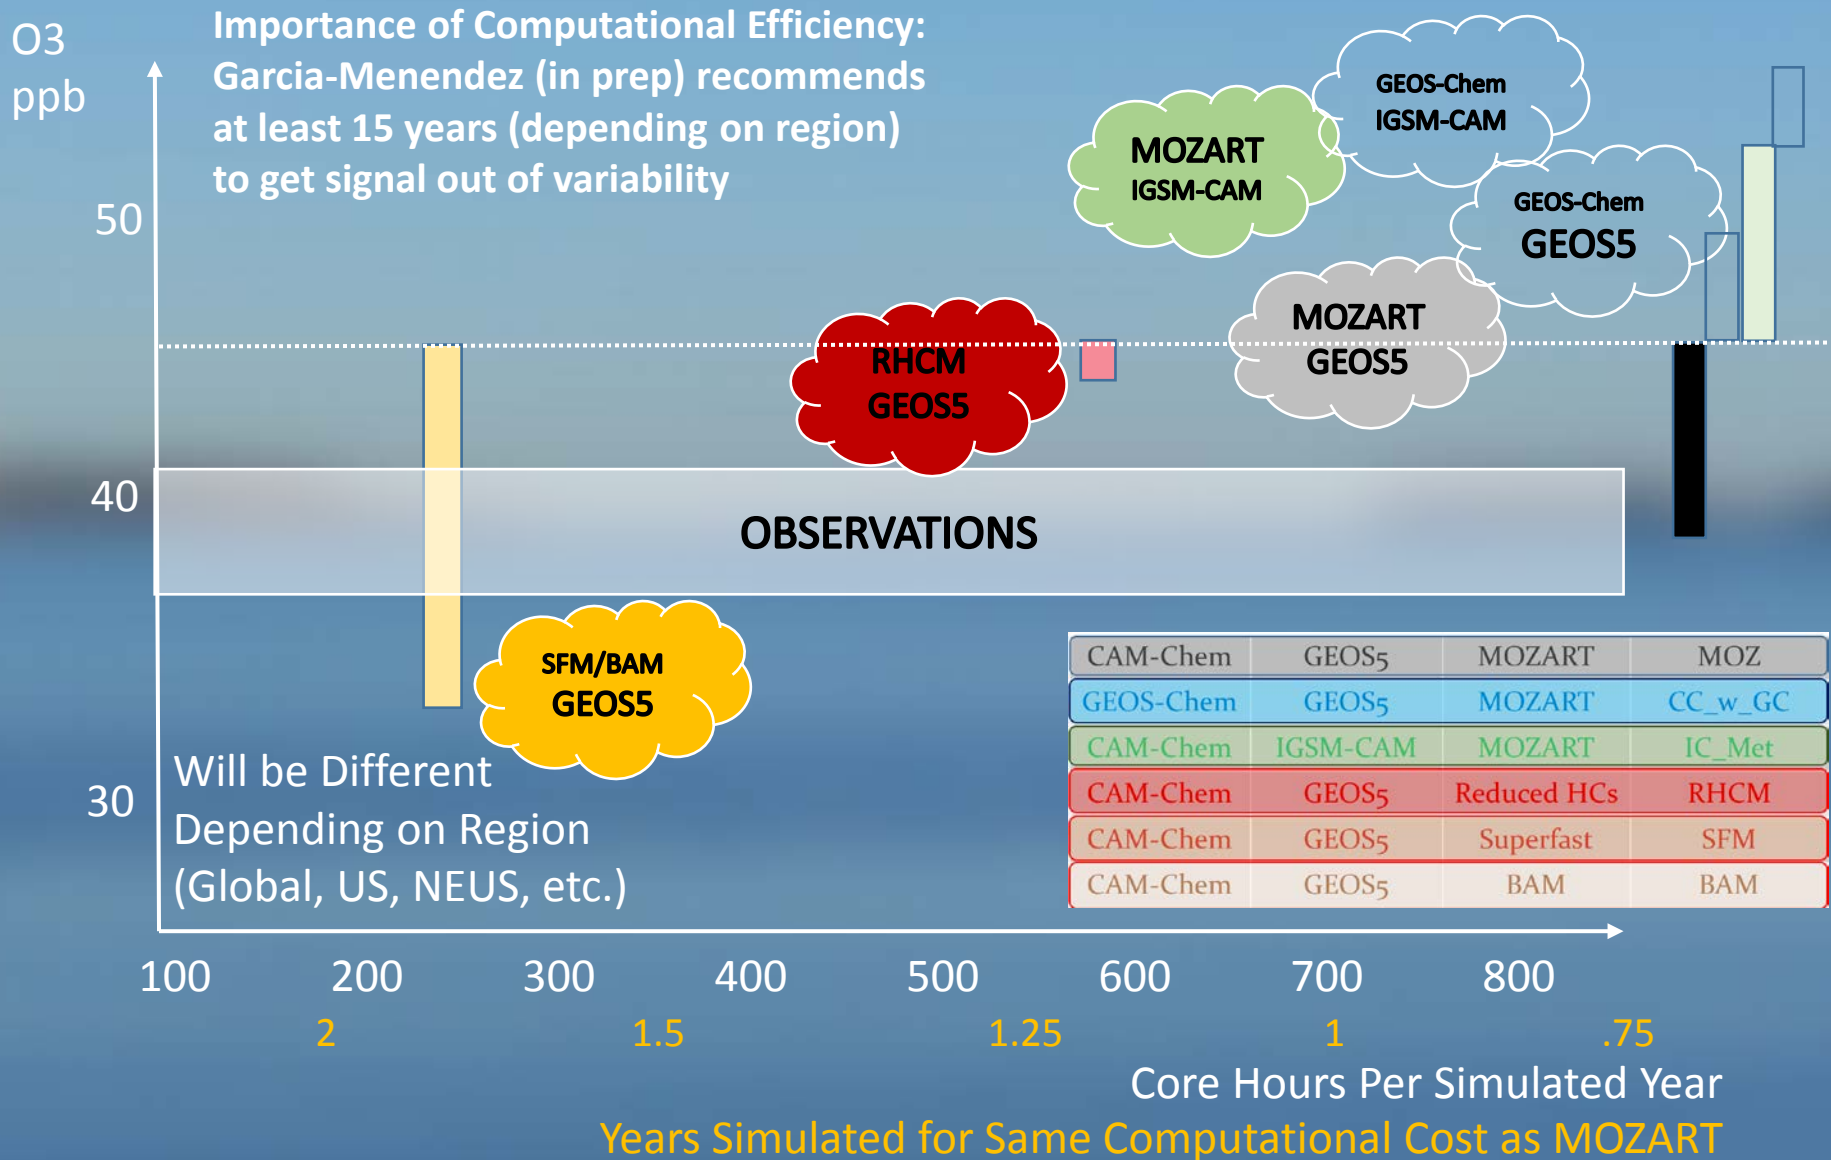

What configuration(s) is (are) the most efficient for human health impact studies? Does this answer depend on region?

Emissions	Meteorology	Mechanism	Abbreviation
CAM-Chem	GEOS ₅	MOZART	MOZ
GEOS-Chem	GEOS ₅	MOZART	CC_w_GC
CAM-Chem	IGSM-CAM	MOZART	IC_Met
CAM-Chem	GEOS ₅	Reduced HCs	RHCM
CAM-Chem	GEOS ₅	Superfast	SFM
CAM-Chem	GEOS ₅	BAM	BAM

ug/kg

CAM-Chem	GEOS5	MOZART	MOZ
CAM-Chem	GEOS5	Reduced HCs	RHCM

RHCM
MOZ

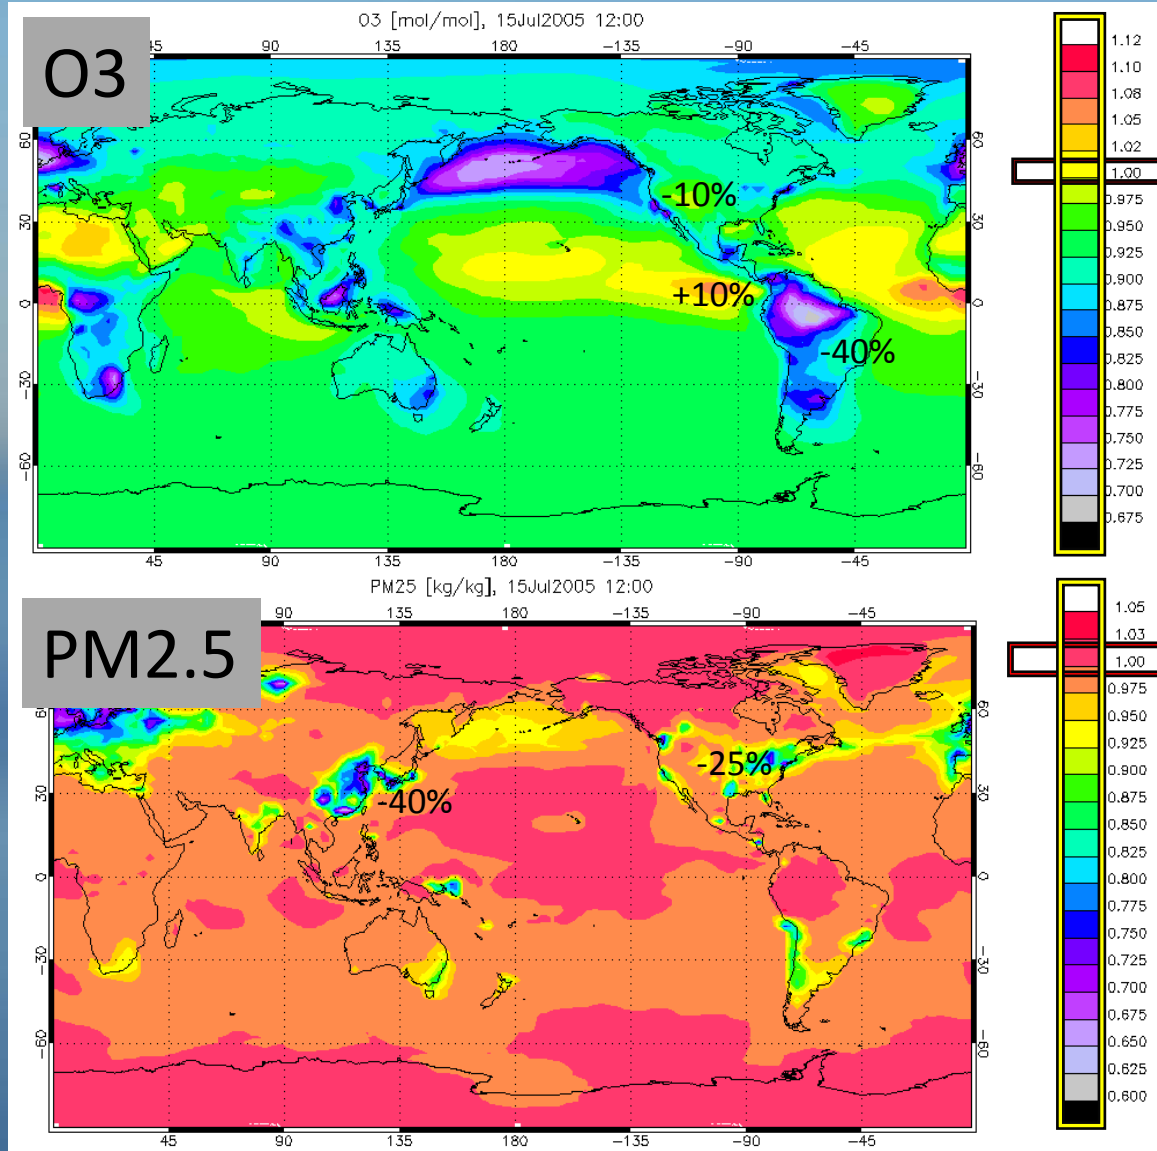

Reduced Hydrocarbon Mechanism (Houweling et al., 1998)

Simplified treatment of hydrocarbons
Different Lumping:
Alkanes - Paraffins
Alkenes - Olefins

Additionally:
Removed Halogen Species (as Stratosphere is Specified), which results in 40%+ faster simulations with only small differences at the surface compared to "full" Reduced Hydrocarbon Mechanism

Comparing Mechanisms

Relative Difference

CAM-Chem	GEOS5	MOZART	MOZ
CAM-Chem	GEOS5	Superfast	SFM
CAM-Chem	GEOS5	BAM	BAM

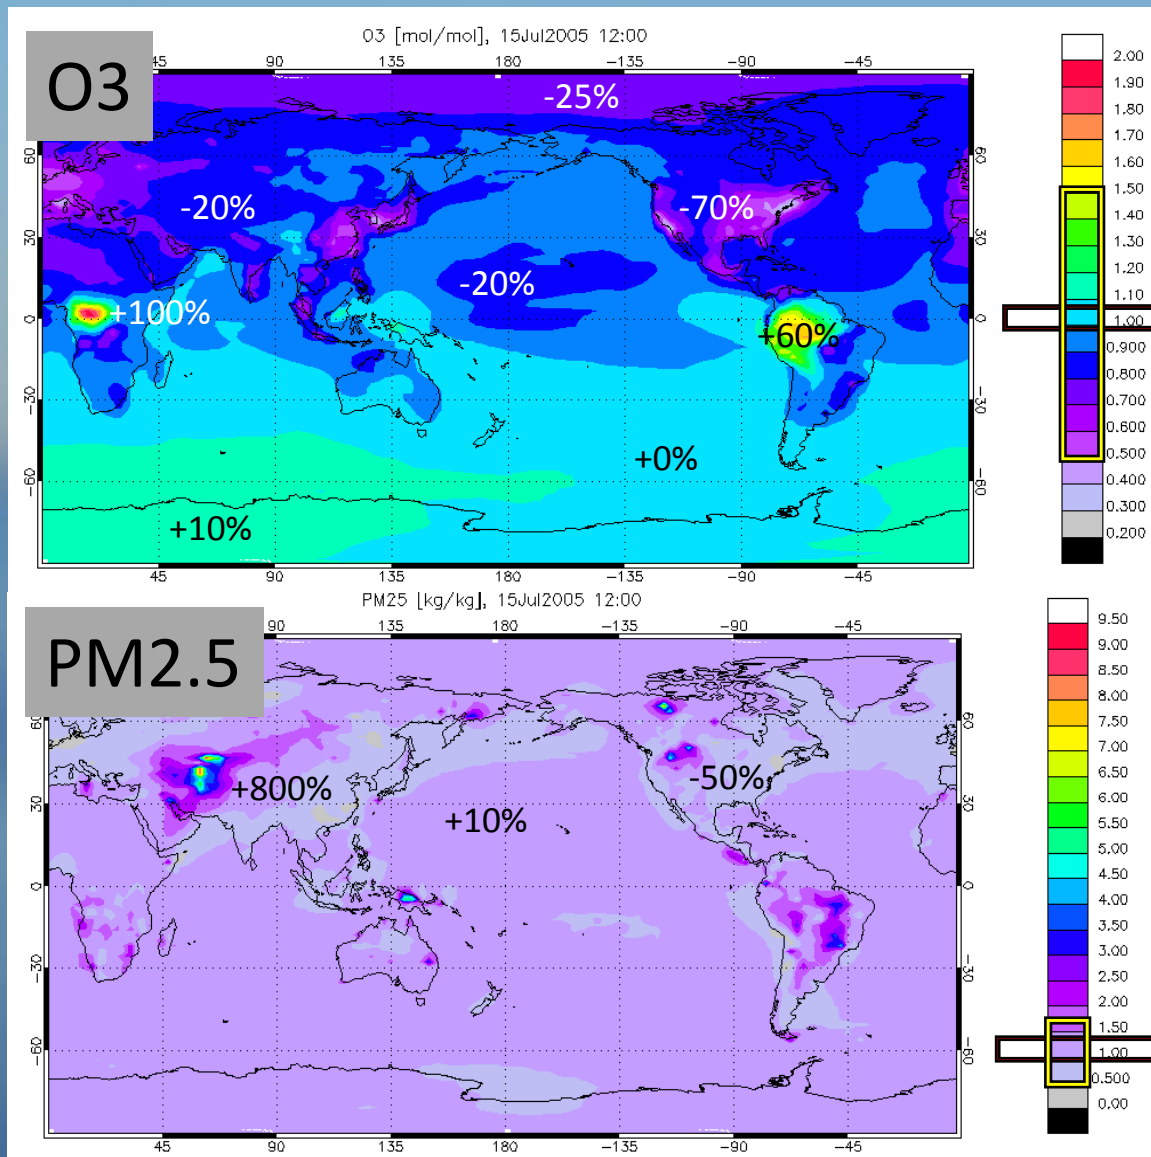

SFM or BAM
MOZ

Comparing Mechanisms

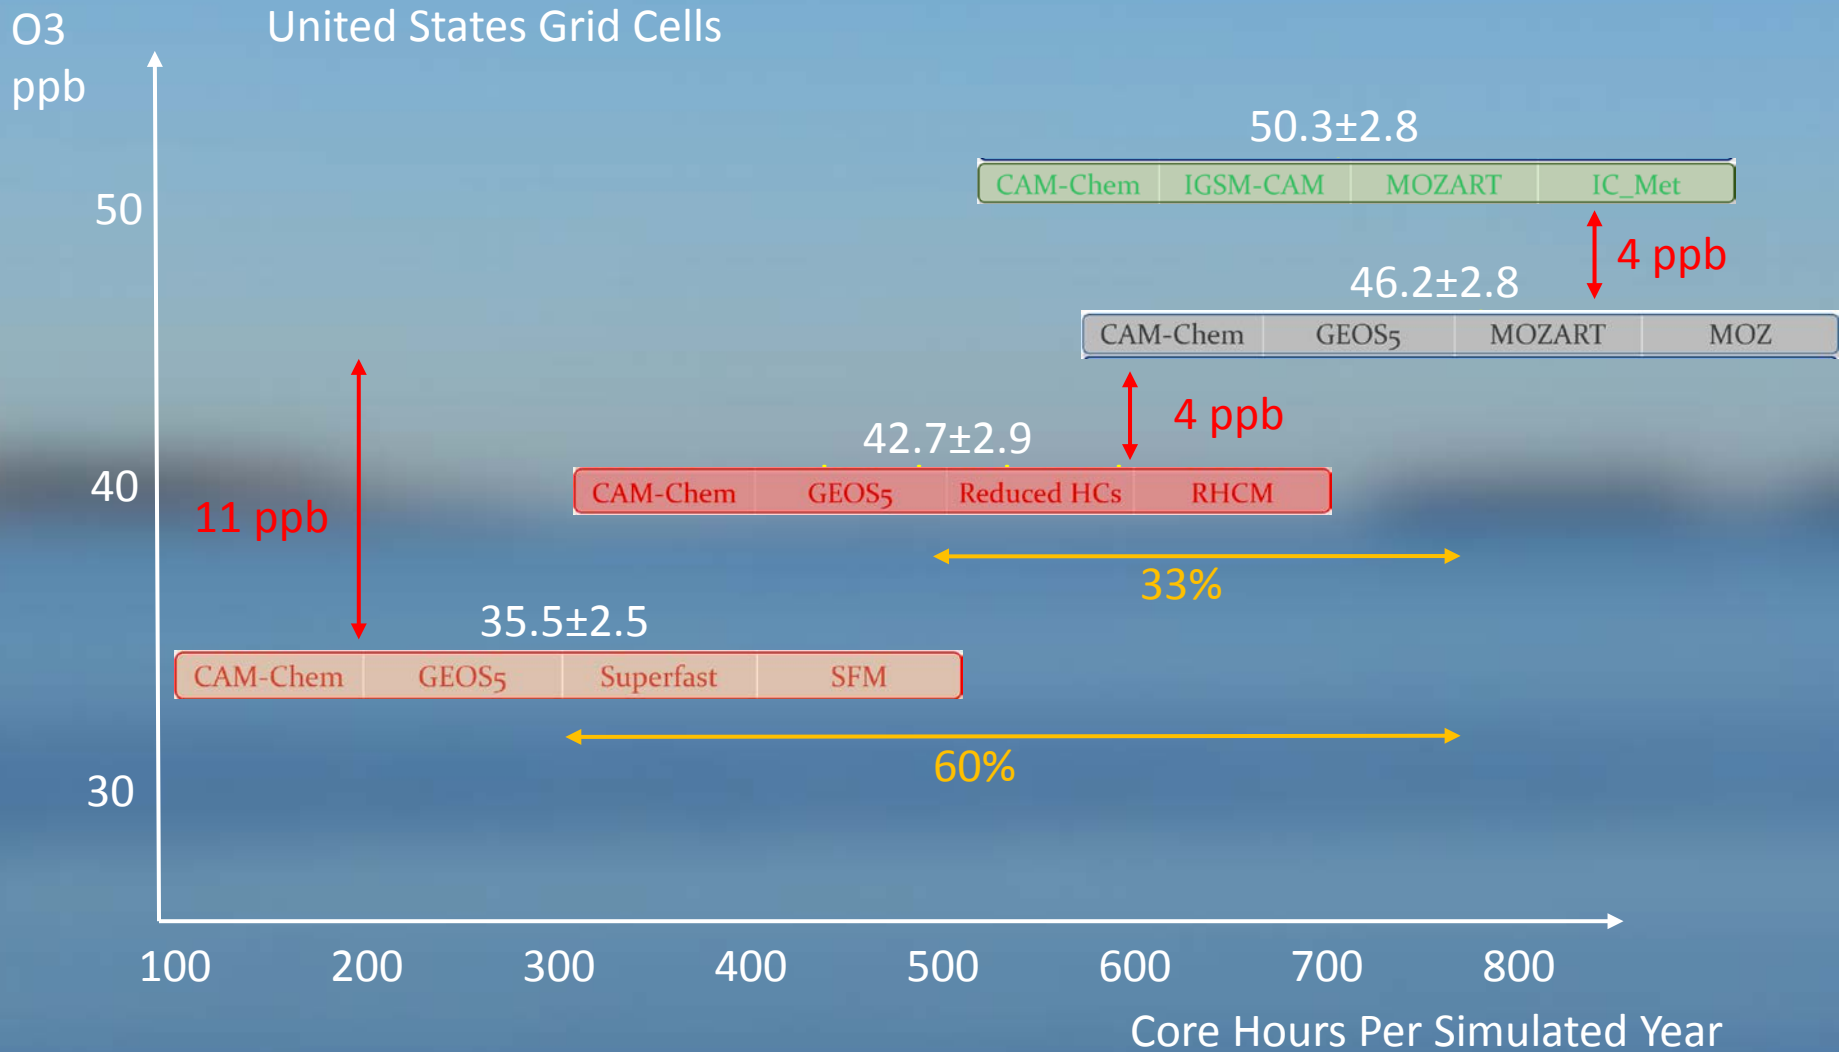

Relative Difference

For Ozone:
Superfast Mechanism
(Cameron-Smith et al., 2006,
Lamarque et al. 2013, others)

For PM_{2.5}:
BAM-Only

Computational Advantages

Quantifying RHCM Acceptability

Difference in Means Test
To determine if RHCM is
Different from MOZART
(taken from Wilks, 2006)

$$Z = \frac{\bar{x}_{MOZ} - \bar{x}_{RHCM}}{\sqrt{\frac{S_{MOZ}^2}{n_{MOZ}} + \frac{S_{RHCM}^2}{n_{RHCM}}}}$$

H_0 : underlying means are equal
 H_A : not equal

As surface time series data for
 O_3 and $PM_{2.5}$ are highly
autocorrelated ($\rho_1 \sim 0.7 - 0.9$)
I use the effective sample size (n')
instead of the
full sample size ($n = 368$)

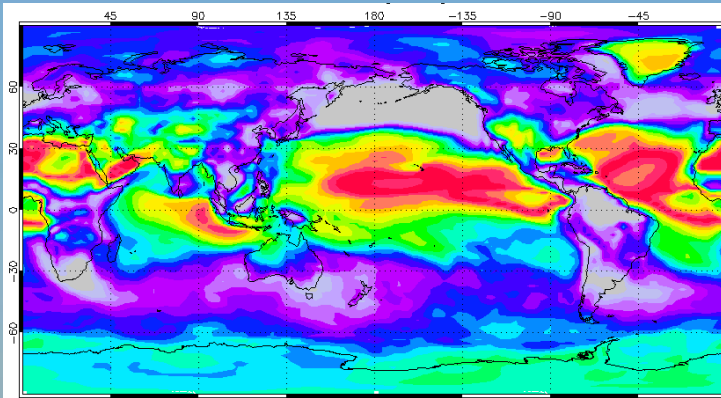

$$n' = n \frac{1 - \rho_1}{1 + \rho_1}$$

Using n'

CAM-Chem	GEOS5	MOZART	MOZ
CAM-Chem	GEOS5	Reduced HCs	RHCM

How do they all compare?

Percent Difference from MOZART Ozone Simulations

First Pass: using GEOS-Chem's emissions in CAM-Chem
Near Future: GEOS-Chem simulations, direct comparison

- Relative Difference: $\frac{\text{CAM-Chem with GEOS-Chem Emissions}}{\text{CAM-Chem with CAM-Chem Emissions}}$

Next Steps

- GEOS-Chem Simulations → Structural Uncertainties
 - standard full tropospheric chemistry
 - GEOS₅ and IGSM-CAM meteorology
- 4x5 degree (maybe T₃₁?) simulations
 - (CAM-Chem and GEOS-Chem)
 - Aiming for maximum efficiency/ensemble sizes
- Comparison to Observations
- Population-Weighted Statistics
 - for Human Health Impacts (e.g. via BenMAP)

More Details About the "Reduced" RHC

All these Plots:
RHCM Mechanism/MOZART

Regular RHC/MOZART

Reduced RHC/MOZART

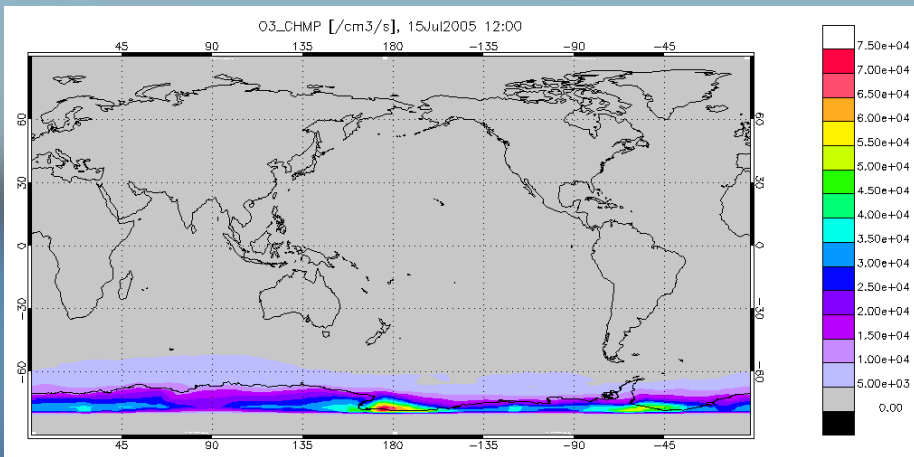

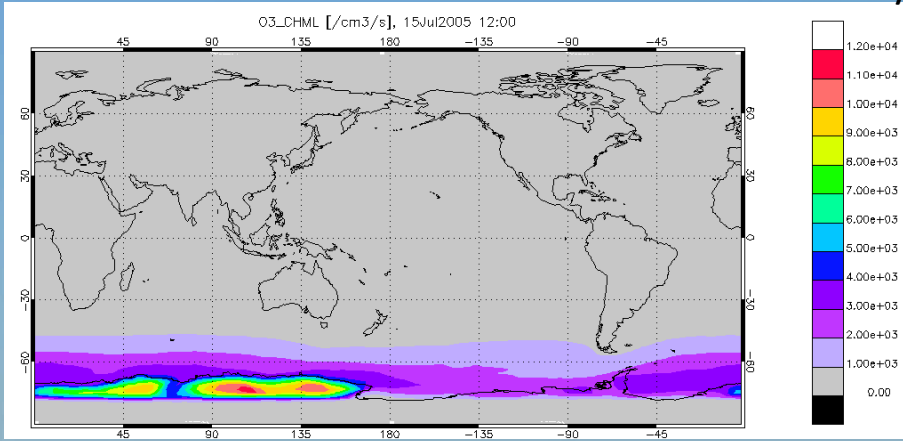

Surface Values, Average JJA, Daily, 2004 - 2007

Difference Between Regular RHC and Reduced RHC:

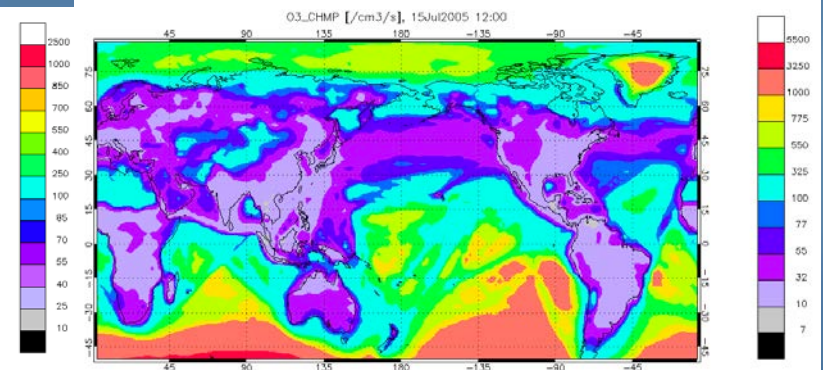

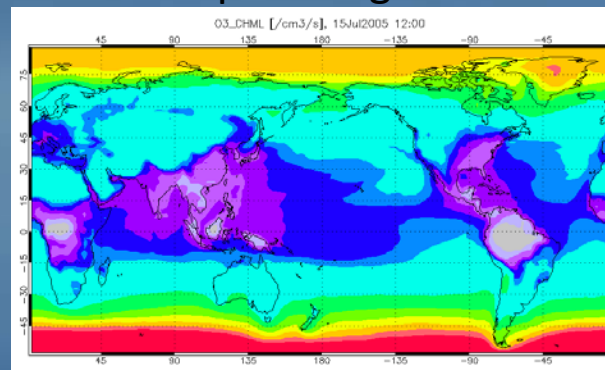

DATA MINIMUM= 0.9999970 MAXIMUM= 1.0000005

RRHCM/MOZART

- Not surprising, as we've removed much of the halogen chemistry, which strongly impacts ozone chemistry over Antarctica
- Everywhere else, there does not seem to be a significant difference in O3 chemistry

If I exclude the southern polar region:
